I have had my Degen DE1103 for over two years now, and I avoid using an AC adapter. I've found that even with the correct adapter settings, the LCD display seems to overload. I have the identical problem with the DE11107 model time display. With NiMH batteries I have no problems what so ever.

Nash,

That's probably very sound advice. I just wanted the adapter
available for situations like I described in my opening post. Guess
I'll need to keep a charged back up set of NiMhs on hand:)

I'm had my Kaito KA1103 for nine months and only use the AC adapter to charge the batteries. I'm amazed how long the 1300 mah batteries last.

I was surprised when I bought another radio that comes with even lower capacity batteries; an Eton E10. It comes with 1100 mah batteries, which weren't charged enough (.60 volts) to power the radio and the radio wouldn't charge them. I charged them in an external charger and haven't had any further battery problems. The E10 is not worth the list price of $130.00 but I got a refurb for $30.00. It has no SSB but has a very clever IF shift that allows you to move an image off something you're trying to listen to. It has surprisingly few images for a single conversion radio.

Great service from radios4you....a working replacement adapter arrived
by USPS today.

1514. Tests and questions...

Yahoo group: de1103
Date: 2008-04-09 08:14:14 UTC
From: Jara
Topic: 1514 Message: 1514

Hi all!

Some tests and modifications and also some questions:

I tested some modification in my DE1103. Sorry my english, I learnt
english 25y
ago.

1/ FM IF filters: better selectivity: you can use other filters, 10,
7HY and 10,
7JA (110 and 150kHz wide). (or two 10,7HY but here is "stereo" narrow
!)

2/ fast AGC: remove 10uF capacitor and use 1uF - it is better!

(see http://www.radioscanner.ru/info/radio/degen2.php but only in
russian
language! direct: http://www.radioscanner.ru/info/radio/degen2/037.jpg
)

And question:

1/ do you know usable SMD JFET for telescop preamplifier which I can
buy in
Europe?

2/ I heard about BF861B and 2SK544 (not SMD), but I didnt heard about
results
with those transistors (?) For instance: can I heard (after change)
VLW, LW and
MW stations via telescope antenna again? Do you know anybody datasheet
of
original JFET in DE1103???

3/ I heard about "two diodes" as protection against electrostatic
charge in
external input. Do you use the same also for telescope antenna?

4/ my friend say, that diodes are very slow, and that small 60 Volt
neon bulbe
is better, what dou you mean about it?

5/ for information: other my friend destroyed input parts in DE1103
this way:
he has one hand at telescope antenna and second hand at connector to
external
input with longwire antenna...

6/ I think that original power supply/charger is not very good, many disturbances from 220V AC net! Did you tested other?

7/ Also "charging" is very poor and slow. Better is if you use other external
accu charger and NOT charging in DE1103! Your DE1103 say, that accu are FULL,
but radio work 3 hours... if you use for your accu other fast charger, radio
work 15 hours...

(But some modification for higher current is also at
http://www.radioscanner.ru/info/radio/degen2/046.jpg - did you tested it?)

8/ NiMH... I feel that NIMH has very strange discharge characteristics and we
cannot use all capacitance of NiMH! (Voltage go very fast down - under usable
voltage for DE1103) Maybe will be better NiCd with lesser capacitance but
better characteristics? Did you tested it?

Best regards, Jara "Rat""

Bob, good for you. I am glad to hear that news.

My adapter is Ktech, Model KA11R080025033N, Input: 110V AC 60Hz,
Output: 8V DC "250" mA.

I tested the adapter I bought from Radio Shack (filtered and regulated)
locally which has 6V and 300mA. I did not find any difference with
respect to hum noises. In fact, I did not hear anything about it in
both adapter, but for sure, I will not use the Radio Shack adapter
anymore. I just will follow the advise of the manual.

Another thing, Bob, I noticed that I have more rf gain when using the
adapter. It could be that the batteries are getting exhausted. But it
is a good thing to have the radio working properly all time.

I heard yesterday night a station from Cali, Colombia, on medium wave,
around 620 kHz. It was clear although it was not so strong. Cali is
2000 miles away from Panamá, the capital city. It was (and of course,
it is so nowadays) easy to hear stations from Bogotá, Barranquilla and
Medellín. Especially from Barranquilla which is a costal city, near
Panamá. Well, the radio is doing a good job for me.

Greetings, Carlos

BF998. 2 parallel transistors. second gate connect to drain.

2xBF998 are better.

> For instance: can I heard (after change)

The same :)

>Do you know anybody datasheet
> of
> original JFET in DE1103???

It is 2SK2394.
You can download on -
http://www.pdfsearch.ru/showpdf-14402-2SK2394.htm

>
> 3/ I heard about "two diodes" as protection against electrostatic
> charge in
> external input. Do you use the same also for telescope antenna?

The external input in last versions DE1103 (IV) switches either an external antenna or the telescopic (that is not good). So, those diods always protect input of the amplifier.

>
> 4/ my friend say, that diodes are very slow, and that small 60 Volt

many
> disturbances from 220V AC net! Did you tested other?

You can increase charge current.
Look at http://www.radioscanner.ru/info/radio/degen2/046.jpg
remove ¹2.
short ¹1.
The charge current becames about 205 mA instead 85mA earlier.
The original power adapter is NOT charger. It is simply adapter, voltage supply.

>
> 7/ Also "charging" is very poor and slow. Better is if you use
other
> external
> accu charger and NOT charging in DE1103!

I agree.

Your DE1103 say, that accu
> are FULL,

I always use a formula:
time of charge = (Accu capacity/charge current) + 5 hours.
So, if you charge your accu by DE1103, then charge at least 11 hours.

> but radio work 3 hours... if you use for your accu other fast
charger,

I didn't. Because, I use external charger.

Good luck!

Some Russian radio amateurs are going to change the default display, CPU and PLL synthesizer.
They are going to show - frequency, signal spectrum, other services. also, to change step of frequency tuning (10Hz), decode RTTY, CW and other. :)
You can see examples - http://www.radioscanner.ru/forum/index.php?action=vthread&forum=1&topic=13752&page=181

1519. SW Preselector?

Yahoo group: de1103
Date: 2008-04-11 05:18:00 UTC
From: benjamesjohnson
Topic: 1519 Message: 1519

I have a problem with terrible heterodyne whistling on my KA1103. It seems on the 30m band and above the whistling can get so bad, that I can barely hear the transmission. It seems to get worse during the summer months. To avoid the whistling problem I usually stay to in the 75m band but these means I can pick up ham QSOs, but I miss out on the SW broadcasters in the higher bands.

I was wondering if using something like the MFJ-956 SW Preselector would reduce this, or solve the problem?

If it would work, I normally use either a Sangean ANT-60 reel antenna or a Sony AN-LP1 Loop Antenna, both which use miniplugs, however the MFJ-956 has SO-239 connectors.
Is there a way of hooking these up together?

Would these antennas be matched to the preselector.

Thanks for any information on this.

Hi,

you can built your home made active preselector....

http://krysatec.benghi.org/phprs/images/200703061018_newpreselektor.jpg

http://krysatec.benghi.org/phprs/images/200703060102_pres1.jpg

but here is better if you use other coils (SMCC) for 50kHz to 30MHz bands: 0,75uH 2.2uH 6.8uH 33uH 68uH 150uH 470uH 3,3mH and 22mH

(0.75uH is two 1,5uH paralell)

Best regards, Jara "Rat"

Thanks for the schematics, but I'm don't have any experience in building electronic equipment. I would probably burn up the components trying to solder them, or short something out.

If there is no reasonably priced SW preselector available for my needs, then I might be forced to try building one, but I'm trying to avoid it.

Are there any commercially available SW preselectors for sale? I checked briefly on the internet but the only one I found was the MFJ-956.

1522. Re: SW Preselector?

Hello, benjamesjohnson,

If you have a tuned antenna you do not need a tunable preamp antenna (as the one made by Ameco). With a tuned antenna you will have a better connection with your radio, minimum signal loss. Most table top receiver use a balanced (tuned antenna). Although those receiver also have an external antenna for unbalanced devices.

Most portable radio have an external antenna input for unbalanced devices such as the Degen DE1103. So, an antenna tuner is not really needed. A preselector, on the contrary, is of much more help. It eliminates o reduces outside signals from the band you are listening.

I am using with great success an Amplified Shortwave Antenna from Radio Shack (#020-280). Unfortunately, it is not for sales anymore. It has a preselector and rf gain knob to increase the signal picked up by the external antenna (this appliance also has an internal vertical antenna, but I do not use it. The radio already has an amplified telescopic antenna). There are two good reasons I use this device. The external antenna input of DE1103 does not benefit from the amplified signal used by the internal antenna or stick, about 10 dB. So I recuperate the amplified signal using the rf gain knob of the appliance. The manual indicates some 20 dB gain but I am not sure about it. But, yes, it does amplify the signal. Second, the connection from the device to the radio has the same plug, 3.5mm.

Everything in life is not perfect. As my english, ja, ja. So you may get some noise out of these devices. But you can use batteries or an adapter plug to a good voltage regulator and line conditioner.

I am sure you can find other preselectors from other companies. Just take your time to look around in Internet. But it will be harder or more difficult to find one with the connections appropriate to the radio. But in Universal Radio you can find all kind of plugs. Then you can adapt a plug suitable to the radio as I have done before.

I am sorry I can not be of much more help to you but, at my age, I even forgot I was a licenced ham radio operator. And, of course, I also forgot many technical arguments.

Best regards, Carlos

Thank you Carlos for your reply. I did not know that the KA1103 external antenna jack does not get amplified. I have always put the Local/DX switch into the DX position regardless of the antenna I used whether it be the built-in whip, my Sangean reel ANT-60, or my Sony AN-LP1.

Speaking of my Sony AN-LP1, I just realized that it does have a preselctor switch (http://www.universal-radio.com/catalog/sw_ant/3676pre.jpg). I do not know if this means the AN-LP1 has a "SW preselector", so there would not need to buy a MFJ-956?

I have stopped using the Sony AN-LP1 (it supposedly is a good SW antenna based on reports), because I didn't notice a difference between it and my Sangean ANT-60 reel antenna. I also didn't notice when using the AN-LP1, if the heterodyne whistling was reduced or not.

I guess I can pull the AN-LP1 antenna out of storage and give it a second chance to see if it does any good (improved reception and whistling).

Thanks for giving me some hope in finding a manufacturer of a SW preselector. I just have to keep on looking.

1524. Re: SW Preselector?

Yahoo group: de1103
Date: 2008-04-12 15:03:47 UTC
From: Carlos Vargas Vidal
Topic: 1519 Message: 1524

It is so good to hear that I have been of some help.

I had the the Sony AN-1. It was not so good but it helped in certain bands or frequencies. It also depends in several factors: the radio and the kind of external antenna you are using. With the AN-1 (which is not rated as good as others, see eHam Net. But take care. Some persons downgrade things just for not so relevant aspects, also because it stopped to work. Many times it happens because they have not been careful about handling things, etc.)I used only the whip antenna it has. I had it in the window close to my desk. In fact, it was a kind of window sill antenna. Please, pardon my english.

The AN-LP1 is a Passport Choice (2008 Edition) and it is considered the best active (that means, it amplifies the signal) for most small portable radios. Now, in this moment, Degen produced another active antenna which is considered good.

A way to know if it has a preselector is to see if it has a band selector. Your can see that on the AN-LP1. There is no reason to have a band selector if it does not really discriminate signals from other bands. The review of Passport to World Band Radio states: "manual preselection: 3.9 to 4.3 and 4.7 to 25 MHz". So you have a preselector in a 2-3/4 stars antenna. You really do not need to spend more, unless you can and want to have more than one preselector. Do not forget that a preselection is better than having nothing. But it is not perfect. It may not carry in outside signals from the band you are listening but it will shows noises linked to that band. Also do not forget about manmade noises. I suggest you not to worry too much about the problems you may find. Try, instead, to learn more about radio listening. There are many good articles here and there. Then, you will know if you can or can not do something about those problems.

Well, you are OK with the Sony Antenna. I thought once to buy one when possible, but the only thing I regret if that it does not go below 3.9 MHz, down to MW. The same happens to my Radio Shack. I have to disconnect the outside antenna from the device when hearing AM broadcasting. It does not have a bypass to use it a simple, passive antenna with my little L inverted antenna.

I was forgetting the most important thing. Sorry. I have noticed that when I use the balanced antenna (Radio Master P30) my preselector does not amplify the signal enough. But when I use the unbalanced antenna (my 15 feet L inverted)I have very good gains in every band segments. An expert can tell you more about. You can find one on eHam and other places. Just ask the question. I do not worry about it. The good thing was that I found out that reality. And I am glad I did it.

It could be that the radio works better with unbalanced antennas. The proof is that it comes with a long wire you mention in your email, the same like the Sangeant, without the rolling wire storage.

Well, I think it is enough. Take care, Carlos

If you are looking for a manufactured preselector (and while I greatly envy Jara's talents in putting one together himself!)...

Check out Ham/SW manufacturer MFJ. Specifically:

Amplified:
http://www.mfjenterprises.com/Product.php?productid=MFJ-1045C

Passive:
http://www.mfjenterprises.com/Product.php?productid=MFJ-956

...I can't vouch for the quality.

I typically consider MFJ to stand for Mighty Fine Junk, but for non-ham applications, you should be just fine!

Greg S

Carlos:

Thank you again for your insight to my problem. Based on what you mentioned I will find my Sony AN-LP1 and give it a try once more.

Your suggestion to learn more about SW listening and not worry so much about equipment is good advice. I will try to learn more about this hobby.

Also your insight to balanced vs. unbalanced antennas with the KA1103, is interesting. I will be looking into the inverted L antenna designs. This design sounds like something I might be able to make myself. I will search the internet for more info on the inverted L.

Thanks also to Greg for tracking down more MFJ SW preselector models that might work.

Finally one responder to my post mentioned the sanity of buying a MFJ preselector whose price almost equals the KA1103. Yes, I was thinking about that aspect and it didn't appeal to me. I know that having a good antenna is one of the most important things to have, but to over spend is not a good idea, either.

Thanks all for your responses.

BJJ

1528. Re: [de1103] Re: SW Preselector?

Yahoo group: de1103

From: Paul
Topic: 1519 Message: 1528

This thread reminds me of the Codar PR40 preselector I used to use with my Trio 9R59DS radio back in the early 70s. I still have the receiver and as far as I am aware, my brother still uses the preselector.

As far as the cost of the MFJ SW preselector is concerned, comparing the price of this against the KA/DE 1103 I think is hardly a good comparison when one considers the exceptionally low cost of the radio. This unit of course would work equally well with more expensive radios where the cost comparison would not be as great.

My main problem with the KA 1103 is not the lack of signal strength, it is being able to hear anything at all through the high noise levels generated by computers, Sky TV decoders and goodness knows what other noise generating devices my neighbours in the block of flats where I live are using.

Paul

1533. Kaito 1103 Backup Radio ????

Yahoo group: de1103
Date: 2008-04-13 18:21:26 UTC
From: Tom Welch
Topic: 1533 Message: 1533

Last monday, I ordered a Kaito 1103 radio
from Amazon and got the radio the very next
day. I have been delighted with this radio
and would like to purchase a 2nd backup radio.
I've been out of SW radio for over a decade.

I'm thinking a Degen 1103, Tecsun 9700DX or
Kaito 1107 as a 2nd radio, I like the analog
interface a lot.

Questions:

1. If I purchase a Degen 1103, can I use
the AC adapter from my Kaito 1103?

2. The reviews on the Kaito 1107 have been
mixed, from raves to very negative postings.
What's the deal with this radio?

3. Is the Tecsun 9700DX a better choice given
that I'm in the greater Phoenix, Arizona area
where performance is always an issue.

4. BTW, I collapse my Kaito's antenna and use a
long wire antenna exclusively, anything wrong
with this setup?

Thank you,
Tom in Arizona USA

Jara:

Thanks for the schematics. Unfortunately, I am very poor at reading even these simple schematics and even poorer at trying to construct such a device. I wish I was handier in doing electronic projects, as I might attempt construction of your design.

Tom, welcome to this forum. I am not the group owner but I am glad to be around. And I am also glad that your are delighted with the Kaito. It will be good for you to read some messages. The radio is, in fact, very good. But it is not an expensive radio and it is not a triple conversion radio. Therefore, you should not expect too much from it and you should handle it carefully. I have followed these advises and my radio is working well. I am glad I read the comments before the radio arrived. Although, some comments scared me. I do believe that the best thing to do is to follow the manual suggestions.

With respect to your questions I will try to answer some of them. I am sure other members of this nice forum can help you, too.

1. Kaito and Degen are about the same. I read the difference was the color, only. Bob told us that his Kaito adapter is the same that I received with my Degen.

2. Both radios (Kaito and Degen) has a rating of 4.6 and 4.7 on E-ham. That is very good if you compare with other more sophisticaded and more expensive radios. I was reading this morning some bad comments about the Yaesu FT-950, which is a tremendous receiver. But, there is nothing that can be done about it. It is an open place to say what you feel. We say in spanish: "cada cabeza es un mundo". It means, more or less, that each mind is different. I recommend you, if I could, to read those reviews from Radio Intel and few other more reliable sources. I do not see any review about the Kaito 1107 in the 2008 edition of the Passport to World Band Radio.

3. I do know nothing about the Tecsun 9700 DX.

4. I also collapse the telescopic antenna when using the external outlet. I have been comparing both and I get better results with the external antenna. It could be that I use an amplified antenna device. Anyway, the telescopic antenna is very sensitive. You can also read some comments about it in the file section of this forum, specially the russian and monitoring times reviews. Most radio manuals suggest to collapse the internal antenna when using and external one. I am sure somebody else can add something more to your question.

It is very difficult to find such a cheap radio with those "amazing receiving characteristics" (words taken from a german electronic lab), so it could be wise to buy a back up. But you can also wait for the Grundig Satellit 750, which will be sold for about $300. That will make this radio the cheapest Grundig "Satellit" radio ever. Of course, it should not only depend on the price.

Regards,

Carlos

Tecsun have not digital dial and also have not all bands.
Degen1103 work also from 0kHz to 40MHz...

(http://www.radiointel.com/review-review-tecsunr9700dx.htm)

And where is SSB and 76-86MHz band in Tecsun???

Hi Carlos,

I keep forgetting to email you offline as it seems our employer
history has some commonalities :)

As for "back ups" I found this thread somewhat ironic because I
acquired my Kaito KA1103 as a "back up" to my Sony ICF-SW77 (currently
being repaired and tuned up). Thusfar the little 1103 has exceeded my
expectations and it unquestionably is a tremendous value for what it
costs.

I also have a Yaseu FRG-7 in addition to the SW77 and KA1103. Oh
there's also a tiny CountyComm GP-4 aka Degen DE-202 in my possession
which really is in a whole other class of radio.

Were I to acquire a new receiver it would most likely be a tabletop
like the Palstar R30CC. Used prices on the Drake R8B put it out of
the question. Frankly the R30CC aka Lowe 350 has a great rep and
costs only a bit over $100 more than the poor reliability plagued Eton
E1XM.
All this said I too will be watching to see just how the soon to be
introduced Grundig 750 shapes up. It'd be nice if it performs as well
as a working Eton E1 but that's probably hoping for too much.

It is Ok, Tom. According to a group I belong, pertaining to the new Grundig, it "may not" have a DSP. That is the reason the radio is cheap. But it "may" have an incorporated preselector. Which is very good.

To my humble opinion, the preselector is better to have it. I do not see a good reason for having a DSP to cope with signals coming from everywhere. With a preselector most signals will be from the right band selected or listened. Of course, I would prefer to have both things. In any case, if the radio comes with a DSP it will be an audio DSP. It will not be an IF DSP wich is more expensive and efficient.

Yes, Tom, we have to learn what we could get for the money we pay. We are lucky enough to have factories like Tecsun and Degen which can produce oustanding economical radios. But we can not, and should not, expect too much from that.

Regards,

Carlos

Good to hear from you Bob, again. And it is also good to hear you did not spend your money for nothing. And that the radio is beyond your expectations.

Yes, it is an irony about backing up the Sony SW-77 (>$400) with the little Kaito/Degen ($49 plus shipping from China). But it is not bad. If you own a BMW car and a Volkswagen, both will take you to the same place; although in different conditions. I believe that the point here is to arrive to the same place than not to arrive at all. Besides, not everybody can have a BMW.

I do believe the Grundig will be a very good radio for its price.

Chao,

Carlos

Carlos:

Several of my friends have aleady ordered the Grundig 750, which I believe is a mistake given the initial problems with the Grundig 800 when it was first introduced. That said, unless the Grundig 750 is an outstanding performer, I probably will not order this radio.

I talked to Sangean America last week and the salesman told me that Sangean will be coming out with a portable radio with strong AM capabilities. Over the years, I have found Sangean to have much fewer problems with initial product releases.

Thank you again for your input.

Thank you,

1545. Odd frequencies silent, even frequencies normal

Yahoo group: de1103
Date: 2008-04-19 15:59:49 UTC
From: setijens
Topic: 1545 Message: 1545

Hey folks,
unfortunately the good surprise (the DE1103 arrived no later than 10 days after I ordered it all the way from China) came with a bad one: After playing around with it for a few hours (listening to Lincolnshire Poacher :)) without problems, the known problem occured with my receiver: Odd frequencies stay calm, even frequencies just work fine.

Is there any remedy for this except replacement? (Keep in mind, I'm not a technician)
And then again: Did anyone ever experience it the way I did? I mean the Radio working normally at start and then suddenly ceases to function on odd frequencies? If yes: Can this also occur out of a sudden after a few weeks/months?

Best regards
Jens

Read the instruction manual(or download it from this Forum's File folder) and RESET the DE1103. If such procedure failed, take the betteries out. Put the radio away for a few days (Hopefully the DE1103 can then be RESET by itself)
Another possiblity is simply a coincident. Those ODD freq. station signals become too weak to be picked up by the radio when the problem surfaced. Also double check if you accidentally switch to "local"(i.e. less sensitive) rather than to the "DX" position
Such suspection can easily be confirmed by other radio at the same receiving locations.

Hope this helps.

P.S.I never encountered such mysterious problems.
Nevertheless what you mean "odd frequencies"?
e.g. 1103Khz(but good for station at 1140Khz), 11.43 Mhz (or any station within the 11.00 Mhz band(s).... etc.?

Hey there,
I tried resetting twice without any effect. Haven't tried to take away
the power for some time - I'll do that.

But I doubt it's a coincident. It hardly can be concidental, that in
the whole AM-Band even frequencies (xxx2,xxx4,xxx6... kHz) can be
heard normally, while odd frequencies (xxx1, xxx3, xxx5 kHz) cannot be
heard at all. (Manual tuning - not automatical!)

If things should change or the seller has any other recommendation,
I'll post it here. Otherwise I'll need a replacement :(

Mmmm... it sounds like a faulty encoder.

I guess I read somewhere stories like that, perhaps in this forum.
Encoders cuurently used by Degen are supposed to be more reliable
than those used in earlier units, but a fault can occur now and then.

Try keying in the frequencies instead of tuning, just to see if it
makes any difference.

Good luck (and apologies for my poor English)

Moises

Where are you located?
Another possibility is that in different regions the Am station freq. spacing are different:
... Medium wave is 520 kHz¨C1,610 kHz. In the Americas (ITU region 2) 10 kHz spacing is used; elsewhere it is 9 kHz. ITU region 2 also authorizes the Extended AM broadcast band between 1610 kHz and 1710 kHz. ....
Sounded like your DE1103 are not designed to operate for your region. (designed only for receiving 10Khz spaced broacast stations)
However if you can pickup those questionble at the first time but failed later then such suspection should be ruled out)

From: stefy506
Topic: 1550 Message: 1550

Hello, I am Italian, you excuse for my not good English. Have problems with Degen 1103.....after 10 15 minutes from the ignition, arrives a bad problem of tuning SW = example = 3650 khz= receiver ok //after jogdial up > 3651 = receiver muting// after jogdial up >3652 = receiver ok.....always the same!!!!!
(The same problem descending of tuning!)

All the other functions with the JOG DIAL is OK!!! ex= VOL/ charge Battery/ Memory/ Clock/ all Good !!

Is Possible defect PLL or VCO??

Adjustment ?? Capacitor sobsitution???

ONLY SW Problem!! FM is Good!!!

TKS!!! Grazie !!!! Stefano.

Hey Stefano,
I've got exactly the same problem. Except that it took place not 10 - 15 minutes after usage, but a few hours after.
Did you buy the receiver on eBay? If so - who was the seller?

If you know of any way to fix this problem, let me know!

Best regards
Jens

Hey,
I'm located in Germany. And as this occurs throughout the whole AM-Band, I think we can rule out anything else. It's not, that stations are weak on odd frequencies - they're not there.
To illustrate the problem once more: xxx1 kHz (loud noise), xxx2 kHz (nothing), xxx3 kHz (loud noise), xxx4 (kHz) (nothing) - and so on.

Really - too bad. I also don't know exactly what to do. What, if my replacement is bad as well? I guess that's the price you have to pay, if you want to save money by buying electronics from China.

Does this occur with multiple strong AM stations?

On my DE1103 (older, replaced encoder), I can tune into strong stations. The bandwidth is such that changing the frequency by 1kHz will make the signal a little less clear. 2kHz makes it even less clear....and so on.

It may not be a coincidence that two new members have a similar problem. Strange that one is SW and the other is MW.

Does xxx1 kHz sound EXACTLY like xxx3 kHz? or is there some variation? You mention 'loud noise'. Is it noise or are you indicting that the station can be heard loudly?

Thad

Hey Thad,
the problem occurs throughout all frequencies. With my example, I only wanted to make it clear, that odd frqeuencies are de-facto muted. Let me give you another example: North Korea's propaganda broadcast "Voice of Korea" sends at 9235 kHz. So I can indeed hear the things relatively clear on 9234 and 9236 kHz as you said but not at all at 9235 kHz. Of course...regarding the program's contents one might argue, that it isn't a loss anyway, but you know, what I mean :)

So basically everything seems to be okay with the receiver, with exception of the reception of odd frequencies in SW. But then again: A receiver without the ability to receive odd frequencies isn't even worth ~ 50 EUR in my opinion.

Best regards
Jens

Well, it looks like you got a lemmon... that is part of the risk of purchasing a low cost receiver. We have to do the quality control ourselves and if it turns out to be a poor sample, we loose.

Of course the e-bay seller will replace it but you will have to pay the freight (postage) both ways, depending of the country you live in it may be close to the price of a new receiver. Now I understand why people living in countries where there is a local shop selling rebranded radios (e.g. Kaito or Thieking & Koch) prefer to buy the more expensive rebranded units which are guaranteed and backed up by a local service.

Given these circumstances it might be wise to buy 2 units at the same time, just in case one of them turns out to be faulty (a kind of self-warranty). Of course if your budget (and the Customs of the country) allow for it...

I purchased (separately) two DE-1103, both are good performers, but in one of them (purchased directly from Degen) the aluminum faceplate got loose... I glued it again but it seems I did not do it correctly and is getting loose again...

73,

Moises

Not necessarily be a Lemmom.
If you got the European version DE1103 and used it in Region 2/America you will face similar problems in America) Since the DE1103 is a double conversion design the freq spacing is set consistently to all AM bands therefore it is NORMAL that you also found the "ODD" freq problems. In some radios --- but not the DE1103 --- they have a switch at the back(or hidden inside the battery compartment) to change 9khz to 10khz -- and vis versa --- but not the DE1103 though. Hopefully someone will suggest a simply method to reprogram the set -- using the Keys(function buttons) at the front panels.

I am sorry I am wrong. I just noted my DE1103 can turned to
all "even and odd" freq step by step continuously; therefore I need
to admit that this one was definately a lemom --- (no likely can be
FIXed yourself)

Sounds as though you have a warranty claim, I would send the radio back to
the local importer.

Hey Stefano,
after some research I found out, that after not receiving SW anymore,
someone once pulled out the battery for about 48 hours or so (I tried
it last night for about 10 hours - no effect) and then things were
okay again.

I'll try this now. But even if it works, it of course would be shit.
At least, if it happens more frequently. Stopping to listen to the
radio for 48 hours certainly isn't a real way of dealing with the problem.

1563. Reliability KA1103 vs. DE1103

Yahoo group: de1103
Date: 2008-04-21 00:26:13 UTC
From: setijens
Topic: 1563 Message: 1563

Hey folks,
due to my recent experiences, I ask myself, if the Kaito-Models are just as unreliable as the DE1103. I mean - are they constructed exactly the same way, or is the construction process modified for these? German imports (about 180 $!) for example are produced differently to comply with European technical standards.
How about the Kaito-Models? I ask, because a friend of mine is also thinking of buying a receiver - and due to my (and Stefano's) experience, I cannot really recommend a DE1103....

Best regards
Jens

1567. LO Crystals the culprit with SW tuning?

Yahoo group: de1103
Date: 2008-04-21 07:55:51 UTC
From: setijens
Topic: 1567 Message: 1567

Hey there,
I've got the following answer from my eBay-seller:

"We made a phone call with DE1103 designer just now, and confirm the issue you mentioned was caused because the 2nd LO stop working, the way to fix this issue is change a new 2nd LO inside (2nd LO is a crystal under the shielding cover).

So could you please kindly advise if you can change it by youuself or not? If is, then we can arrange to ship some of 2nd LO crystals for you."

I suppose I've got to say no, as I until now don't even know what a LO crystal is. Does this make sense to anyone, and are there assembly instructions anywhere?

Best regards
Jens

The DE1103 is a double-conversion superhet - the received signal is up-converted to a VHF IF, filtered, and down-converted to 455 kHz where the main filtering takes place. The mixers use local oscillators (LOs) and it is the second mixer LO crystal that needs replacing.The first mixer is driven by the frequency synthesiser.

Hello!
The second heterodyne (oscillator) is broken.
You should use warranty.

Good luck!

1571. Re: 1103 Reliability

Yahoo group: de1103
Date: 2008-04-21 15:13:27 UTC
From: Bob
Topic: 1563 Message: 1571

Jens,

I concur with other comments here. First both the Kaito and Degen are made in the same factory and differ only in the cosmetic badges on the exterior. Second, reliability appears to be pretty darned good with the current production. Bugs, as are found on any model, have long since been worked out. As an aside, from available documentation, the much more expensive (and capable) Eton E1XM has a much higher incidence of problems and warranty claims.

I also have a Sony ICF-SW77. The original I bought was recalled and exchanged for an improved "second generation" model by Sony. It has worked flawlessly since 1991 until recently when leaking capacitors necessitated a repair. Not too shabby for 17 years service. Nor is the functioning of a Yaesu FRG-7 purchased with mods from Gilfer in 1984 that has not needed any attention since. I suspect my Kaito 1103 will hum along for quite some time too.

Now the mystery identified! It may not be cost effective to ship
the bad unit back for replacements. Likly needed to be fixed by
yourself or by the local repairing shops/or event your local Degen
distributors --- if you are luck!
Why keep on asking the seller details for the HOW_TO_FIX
instructions. Hopfuly you will receive copies of
drawings/procedures ... etc rather than email statements.

PS Highly suspect this problem only occured in the current
production runs either due to bad components or a new design revision.

1574. Why is the LO Crystals the culprit with SW tuning?

Yahoo group: de1103
Date: 2008-04-21 23:00:43 UTC
From: Thad Larson
Topic: 1567 Message: 1574

Using the block diagram in the files section:

DE1103-block-diagram.jpg (http://f1.grp.yahoofs.com/v1/YA4NSG7yw8oHcvsUOzm9CZTBZCOB6guQCkQA-QMm7ydohdFwIpS4iINBwpeAm6UUQ8G4w0BaAKMoe3vKfr4SvCUMUruaeZPda4zucIVqsg/DE1103-block-diagram.jpg)

http://groups.yahoo.com/group/de1103/files/DE1103-block-diagram.jpg

Can anybody in the group explain why a bad 2nd LO would cause one frequency to work, but the frequency specified 1kHz away would not? Looking at the schematic, I can see why it would affect AM and not FM, but I am unsure as to why 1/2 the frequencies would be 'missing'.

Thanks in Advance!!

Thad

>
> Thanks for the info. I have the schematic .... which Xtal and 'to be
> replaced? Example = U8? U ....??
> What?

U8 - The third oscillator (for SSB).)
But 2nd are Q2, U6, D601.
Look at your receiver, you can see:
...DUAL CONVERSION...
So, first Intermediate frequency (IF) is
55.845 MHz (T601, U1,...),
Second IF is 450kHz, that follows from
IC6 (pin 1).
Q2, U6 - second oscillator (55.394 MHz +1 kHz)
for this conversion (from 55.845 to 450).
PLL (IC4 and VCO Q13) of the receiver has 2 kHz step of changing of
frequency (even frequency). When the indicator shows odd frequency,
PLL doesn't change frequency, but 2nd oscillator increase one
on 1 kHz. When the indicator shows even frequency, PLL changes
frequency, but 2nd oscillator decrease on 1 kHz.
So, if your 1103 receive on the even frequency and doesn't
on the odd then 2nd oscillator has failure of generation
when it tries to change frequency on 1 kHz.
You can try to change parameters of the 2nd osc.
There is the red tuning condenser next to the second oscillator.
Try to tune it. Check circuit - D601, R615..

Sorry for my English, I hope that I helped you.
Good luck!

I think.. yes. Because, even frequencies normal. It doesn't work only
when oscillator tries to change frequency on 1 kHz.

> Ahhh everything's ok! With calm the next day try '!

OK.

Well folks - the story continues for me. Seems to be my luck to have bought from Tao Qu (tquchina), who seems to be quite a nice fellow. I had to return the radio, costing 10 EUR. But he'll pay the shipping of a new radio and will ship it prior to the arrival of my return there. And he'll include a carrying pouch free of charge. Quite a service for a Chinese mass seller, I'd say.
Let's hope I'm luckier this time.

Best regards
Jens

Subject: [de1103] Re: Odd frequencies silent, even frequencies normal

Well folks - the story continues for me. Seems to be my luck to have
bought from Tao Qu (tquchina), who seems to be quite a nice fellow. I
had to return the radio, costing 10 EUR. But he'll pay the shipping of
a new radio and will ship it prior to the arrival of my return there.
And he'll include a carrying pouch free of charge. Quite a service for
a Chinese mass seller, I'd say.
Let's hope I'm luckier this time.

Best regards
Jens

Hi Wind NV,

I think you are exactly right about the 2nd oscillator half steps, good catch. It looks like the diode D601 adds C616 (10p) in parallel with C617 (102p) to cause the 1kHz shift. I would guess that C616 is short or wrong value. If the oscillator is strongly shifted by a wrong (large) value then 1st IF filters and 2nd IF filters wouldn't line up and radio would be effectively dead.

Still, a hard fix for the typical user so back to the seller it goes...

David Smith

Hello Stephen,
I doubt that there are conditions for a satisfactory repair of radio.I council to contact the seller for the refund, perhaps lose shipping costs, but you enjoy listening quiet!
Hello.
Francis

Ciao Stefano,
dubito che vi siano le condizioni per una riparazione soddisfacente della radio.Ti consiglio di contattare il venditore per la restituzione,forse perdi le spese di spedizione, ma ti godi ascolti tranquilli!Ciao.
Francesco

MADE RESOLVED PROBLEM REPAIR! Friend thanks for the precious information which you have sent me,thanks to everybody you and especially to David Smith !!!The defect was coming from the condenser C616 (10 pf)what was not present! he was lacking from the factory!!! Have pratically inserted a 10 pf to place of the missing condenser, but what must be as present as the wiring diagram shows!
At this point think of what many others Degen 1103 turns out the same defect!And been a work very difficult, all in smd ... uhhhhh ... . Work for micro surgeon's hands.....would not maybe do again him ... ahhhh!!!
I have aprofittato to make the "screening" recommended by Radoscanner RUSSIA, very important this, the radio was open so I have thought I would make all the work.
If someone wanted to repair Degen alone I can send INFO on as intervene. It is a simple thing to replace the condenser, but it is difficult to locate it because it is hidden under one metal screening.
If you need contact me ... . In my "child" I can help with info and drawings. Thanks anchors! Stefano

mmm... I think .. You probably were not right, new version of DE1103
(IV version) has a trimmer condenser (red color, next to metal
screening, I wrote earlier) that, I think, is instead C616. So, you
should tune this condenser only, because your DE1103 periodically
works.
In old versions, this tune could be made by tuning T1.
The wiring diagram is not new version, so there can be differences.
Though, if your DE has worked well, let remains so. :)

Good luck!

1589. Impressions on new Degen 1103

Yahoo group: de1103
Date: 2008-05-04 23:51:56 UTC
From: pphilbro
Topic: 1589 Message: 1589

Hi all,

Just received my new 1103 last week to supplement / replace my aging Sony ICF-7600D that I purchased 25 Years ago..

Here are my impressions:

Smaller than the Sony, nicely constructed with well moulded case.
Slightly better performance on MW (BCB) and SW but not quite as good on FM.
SSB performance is amazing, much better than the Sony.
Distorted MW audio at all volumes.
General audio not as good as Sony.
Stereo via headphones is immaculate.
User interface a great compromise, very easy to get to the frequency required, volume control not a problem.
Plenty of memories 100+ compared with 10 on the Sony.

I couldn't stand the MW distortion so I did the modification suggested elsewhere on this Group shunting R223 and R224 with 1.8K resistors. I found R223/4 to be 2.2k and R226/8 were 3.0K. The audio is now very acceptable.

While I was in the case I noted a number of differences to the original circuit and pictures on this site.
The whip antenna connection now has a couple of back to back diodes across it to discharge ESD.
There is more shielding.
The Jog control is different and glued into the case.
The band pass filter on pin 1 of the FM converter is missing.
The switched audio shaping around Q9 and Q10 is missing.
A large 1000uf capacitor is installed near the battery case.
The external aerial circuit seems to have reverted to being connected to the balanced mixer and works on MW.

Overall a great little radio with very few vices.

I bought the Kaito version about a year ago and haven't had any problems with MW audio. I'm glad to hear that you're knowledgeable enough to dig in and do modifications. I do not go inside radios. That's an accident looking for a place to happen.

Hi, it is good to hear more about your new Degen. The information has been revealing. Thanks.

I received mine in Panama about two months ago also from a chinese eBay supplier. It is working Ok.

I used to open radios and looked around. But they were other kind of radios.

There is something that disturbs me. It is the serial number. It is AI04... For some reason I have thought that my radio is a refurbished radio. And the serial number also push me to think in that way. Therefore, I would appreciate to know about your serial number.

There is also something I do not finish to understand well. The english translation from the russian web page review of the radio do not help too much. It is about the external antenna change from the older version of the radio. Can you explain that to me?

Well, thanks again. I am glad you like the little radio. It is a marvel for its price.

Carlos

Cannot tell you the serial number at the moment, I will have a look tonight and post it.

From how I understand it, the first versions of these radios bypassed the RF pre-amplifier when using the external aerial.

According to the Russian site later ones did not bypass the pre-amp and therefore were subject to overload and cross modulation when using an external aerial. They also seemed to suggest that these models did not allow the use of an external aerial on BCB.

Certainly mine does bypass the pre-amp and allow use of an external aerial on broadcast band.

The sticker with the manufacture date on it was sometime in January 08, again I will confirm this tonight when I get home..

Ok Carlos,

The serial number of my radio is A1068823 and the label in the box had
08 01 04 on it which I assume is 4th January 2008.
I wonder how this compares with others in the group?

"Broadcast Band" is a term I've heard here in the US - it means the
520-1710 kHz "medium wave" band.

OK. Thank you Dave!
Yes, new models cannot use an external aerial on BCB.

Hi pphilbro,
I also purchased my DE1103 on october 2006 after about 20 years using a Sony ICF-7600DS (roughly the same as you have and also a very good receiver) and had the same impressions. The Degen sounded poor when compared with the Sony (perhaps a bit too tinny) but this is to be expected as the Sony has a larger and better loudspeaker (and a bigger case)

However I didn't notice any distortion on MW or on any other band. I have read about some 1103's with distorted audio but it seems to be a problem of a batch with wrong values in some critical resistors. This QC problem dates from long ago and seemed to be solved out.
However... QC is not the best of Chinese manufacturers, who knows...

I also found the SSB far superior to that in the Sony.

I am glad to know that the infamous vulnerability to electrostatic disharge was also cured. It seems so easy to solve, hard to understand why they did not address it before.

As to the issue of serial numbers raised by some people here, I own two units, one purchased directly from Degen via Hong Kong Tecsun's office (october 2006) and the second one from tquchina (february 2007), and neither of them have a serial number! I didn' find it strange, until I knew that they usually do have serial numbers on it!

However both units perform satisfactorily. My only complaint is that in the first one the faceplate got loose after some time, an obvious QC issue. Also the whip is not very robust, I ceased to handle it in the first unit as it was also getting loose. This is also a known issue of this radios.

I hope you continue enjoying this little and wonderful receiver.

Moisés: the serial number is inside the batteries compartment. Thanks to the amigo from Italy I see that I was right. His serial number is much higher than mine. During the time I received mine I read somebody received his with the serial number AI06... which is closer than mine but still higher. Anyway, there is nothing I can do now. Also, the radio is working well. Besides, if it is a refurbished one that means that the radio was updated. I hope so.

Saludos,

Carlos

Hi Carlos,

At 12:57 06/05/2008, you wrote:

>Moisés: the serial number is inside the batteries compartment.

Well, there is no serial number in my first Degen, purchased from Degen.

Previously I did not see any number in the second
receiver, even in the batteriesy compartment.
However after reading your message I have opened
the battery compartment again, and there its:
AI040359, just located in an unobvious position
which cannot be seen immediately after taking the batteries out.

Thank you for calling my attention to that. Does
the number have any meaning? I received it on February 2007.

73,

Moises Knochen
Montevideo, Uruguay

I have a 1103 purchased in Dec 07 from Australian Auctions on Ebay.
The serial is A1004702. I kept the box but don't see any label on it.

Moisés, I believe the serial number has to do with the production line or output. If it is so, my serial number should be well above AI04... since I received the radio one year after yours (february 2008). But, as I said before, nothing can be done about it.

In the next message, a friend from Australia mentions that there is no label on his radio box. Mine does not show that label either. We need more information. I have three labels glued to the front of the box, but they have no numbers. It was suggested that the label shows the date of the production, if my memory has not failed.

Well, I am glad you know something more about your radio. Carlos

Hi all,

The label with the date was loose inside the box, and I almost overlooked it. It is about 4cm by 2cm with white and black with blue printing that looks as if it is from a rubber stamp. the printing is in three rows, in my case:

DE1103
08 01 04
(3)

1606. Degen won't switch on

Yahoo group: de1103
Date: 2008-05-08 09:45:33 UTC
From: ian.campbell99
Topic: 1606 Message: 1606

I went to switch on my 1103 this morning and nothing happened. Checked the hold button but it wasn't on hold. The clock was working and showed on the display and the hold button would show a key on the display also when I pressed it but the radio wouldn't play. I tried fresh batteries and then put it on the power pack but no go. I was just thinking about a reset when I thought to try the alarm. That indicated on the display ok so I set it to switch on in 5 minutes and lo and behold on it came. I have powered it on and off a few times since and it seems ok. Hopefully this isn't the first symptom of some problem.

I share this experience with you in the hope it may help some one else who encounters the same problem.

1609. DC noise when on charge and line-out issue

Yahoo group: de1103
Date: 2008-05-08 20:45:34 UTC
From: rutja76
Topic: 1609 Message: 1609

Hi all!

Despite the subject of this message, let me say that I just got my de1103 and I am really enjoying it. Above all, fantastic audio for such a small and so cheap radio!

Let's go now to the two main points of this message:

1. DC noise when on charge
I can hear a slight DC noise (quite clear if using ear buds) when the radio is attached to the charger. It disappears when on battery. Has someone else experienced the same?

2. Line-out issue
Connecting the line-out to the mic-in of my laptop, the noise in the radio increases incredibly. Is that related to the fact that the input on my laptop in mic-in and not line-in?

I'm sorry if these questions have already been asked before, scrolling the old messages is a quite impractical on Yahoo groups.

Cheers,
Raffa

Topic: 1609 Message: 1610

Hi Raffa

Re issue number two. The increase in the noise level would in all likelihood be caused by the processor in your laptop. Computers are a very large source of RF noise.

Paul

1611. short(ish) introduction

Yahoo group: de1103
Date: 2008-05-09 06:00:18 UTC
From: Kaligus Campbell
Topic: 1611 Message: 1611

I have owned 1 de1103 for just over a year, and 1 (heavily modified) for a few months.

I did not know until reading messages here that there was a difference between the two radios, however modifying the newer radio appears to have been a good theory LOL.

The newer radio has had the whip antenna removed. (I have a spare if someone wants to buy one.) and replaced with a short stub of coax with a bnc end for use with several home brew antennas. Extra hot glue added for stability, and the switch in the antenna jack made solid (soldered in the whip position) and then glued as well.

I experience this from time to time depending on factors I have not yet
identified (short intro to follow... both radios exhibit this). I assume
there is something to do with battery level, charging level, etc.

>
>2. Line-out issue
>Connecting the line-out to the mic-in of my laptop, the noise in the

I agree somewhat with the already posted reply.

I have found that of the 7 sound cards I often use the laptop is the most
annoying in this realm.

I have however found that there is far more noise on mic in unless I build
my own cable. Mic in has a pinout (shield)=ground/earth (ring)=5v
(tip)=mic-in. This causes grief with most devices not expecting to have
the non-phantom power applied to them.

In leu of making your own cable, often a bit of fingernail polish carefully
applied in a couple of layers on the (ring)s of the cable does wonderful
things to the noise level

I'll try to be more clear on the mic-in issue I mentioned. The
increased noise I'm talking about comes from the radio, not from the
laptop. I mean, as soon as I plug the line-out of the DE1103 to the
mic-in of the laptop, I hear much more noise coming from the radio
speaker.

Cheers,
Raffa

1614. Re: DC noise when on charge and line-out issue

From: knyuen88
Topic: 1609 Message: 1614

Please remember ëither using "line-out" or "line-in" the coaxial cable connections between the radio and the computer are always connected (both shared the same commond grounds via the coaxial shields) As a result computer's noises can still passing through and picked up by the radio.
I think you can confirm such by shut down the computer completely (not just in STANDBY mode --- also disconnect all cables --- printers, moderm, ... that hooked up to the questionable computers.) likely the noise was gone --- at leasts weakened.
Please let us know your findings.

Hi Raffa,

The noise from the laptop will be picked up by the radio. The noise is an RF signal, to put it another way, the laptop is acting like a transmitter and the noise is being transmitted.

You could try combating the problem by using an audio lead that has filters incorporated in it. I'm not sure if this would work but it could be worth a try.

I have the same problem with computer noise here too, the only way that I can fix the problem is to switch everything off and turn off the power.

This also applies if you have a pay TV decoder, bedside lamps that you can adjust the brightness by touching the lamp's body. In fact any electronic device could be a source of noise.

Paul

1616. Self-oscillating preamp

Yahoo group: de1103
Date: 2008-05-11 19:59:14 UTC
From: kozeluh.rm
Topic: 1616 Message: 1616

Dear friends, I have on my DE1103 following problem. When operating with external antenna (preamplifier is switched off)radio works fine but when using telescopic antenna (preamplifier with Q1 is active) I hear in the signal on SW bands noises like Q1 preamplifier is self-oscillating. Has somebody met similar problem? What would be the best way to fix the self-oscillatng. Any advice would be appreciated.
Thanks, Tom OK1FSX

I'm not sure but it seems to me that the problem is the mixer (Q7, Q8)
self-oscilating.
Try to put a resistor 200 Ohm between G pins of the Q7, Q8.
It also give 50 Ohm impedance to an external antenna that is good.

1619. New 1103-- Some questions

Yahoo group: de1103
Date: 2008-05-12 16:56:18 UTC
From: Claudio Leite
Topic: 1619 Message: 1619

Hello,
I just received my first KA1103, which is also my first "real" radio. I've been reading the archives and documents for a few days trying to get a grip on what I might have to do for an optimal experience.

I have one question which I could not find an answer for: should the tone switch work when using line out? It's my impression that it shouldn't, but it certainly is doing something when I try it. I'm not necessarily complaining as SW and talk sounds better on the narrow setting through my speakers, but thought I'd ask anyway.

Additionally, my radio came a bit blemished out of the box. The speaker area has two dents visible under certain angles and the plastic over the LCD has some scratches again visible under certain angles. Is this normal, or an indication I actually received somebody else's returned radio? From what I read QC is a bit questionable with these radios, and since the reception seems OK I am a bit reluctant to exchange it.

Thanks in advance.
-Claudio

The "tone" switch acts as a "pure" tone switch only when you are
tuning to FM (I didn't check if it has any effect on the audio
quality coming out from the "line out" jack).

In fact when tuning to AM (i.e. MW and SW) the switch doubles as a
bandwidth selector, used to change the IF filters. Of course changing
the IF bandwidth has also an effect on the audio quality, and it
should be noticeable even when you listen through the "line out" jack.

Hope this helps

I understand that you purchased a Kaito brand radio, I do not have
experience with them. My two 1103's were purchased from China and
were well packed and had no cosmetic issues. However if you are
willing to pay the overprice that Kaito charges, I think that the
radio should be in pristine condition, or otherwise you can request
an exchange for a new unit in good condition.

Yes, I purchased the Kaito branded version from Amazon. I just requested
a replacement unit and hopefully since they are a reputable retailer
this will not be a problem. It really looks like a used radio, and now
that I think about it I don't think it was sealed when I opened the box.

Thanks again.
-Claudio

I bought it from Amazon. It says "sold by Kaito Electronics, fulfilled by Amazon." The latter meant I got free shipping and the $93 price tag was good compared to other retailers.

As I said on my last post I asked for a replacement but I received this idiotic reply:

... "because Kaito Electronics, Inc. inventory is constantly changing, we can't replace any items sold by Kaito Electronics, Inc. that are Fulfilled by Amazon."

I don't know what inventory isn't constantly changing or why this should matter, but in any case the automated message said I can return the radio. I would hope they pay for the return shipping because it's their fault.

This is my first bad experience from Amazon but has definitely left me soured.

I see there are a lot of Degen-branded models on eBay for export. Does anyone have any experience with these as far as shipping to the US?
I recall reading something about a 220V-only power adapter; I wouldn't much use the AC and I can buy a replacement easily so if that's the only concern it won't be a problem.

Thanks again.
-Claudio

I think this might be a case for intervention via landline if you can locate
a phone number .... I would have thought Amazon's remark would be against
any consumer guarantee laws you have.

Call Kaito and ask for Lee in sales. He was very helpful with a similar problem I had and is great to work with. I think they would be happy to help you out. My KA1103 that I got from them is a great performer.

Both of my Degen branded 1103's the tone switch affects everything, my
manual states that to be the case IIRC.

Radio #1 came blemished and a little tooth PASTE and a soft microfiber
cloth did the trick. Radio #2 came perfect and that is the one I blemished
with mods LOL.

No idea but for the cost of #1 (friend brought it back from China directly
in his pocket) I would not complain even if it has not been otherwise fully
functional.
#2 is an ebay special I expected to be used "as advertised" but I cant find
where or how it was used, including the packaging. "better than
advertised" for once.

The "tone control" is actually "narrow wide" switch that changes a
filter in the IF and thus the bandwidth and yes, will affect the sound
on the line output (exactly as intended)

de Joe

Not at all bad for a $49.99 radio and $65 worth of components. The 1103
probably will never be mistaken for a communications receiver, but with
a good antenna in the right conditions, with a pre-selector and a bit of
luck, it still might be really useful.

I have not specifically done any RDS (yet), and I believe that you need an fm radio with MPX output which I dont think the 1103 has (and would love to be proven wrong, I inherited an RBDS decoder similar to http://www.techdesign.be/projects/021/021.htm I was planning on playing with this weekend).

Regarding RDS, look at this site. There are nice pictures but no
tecnical details about this modification using an external device.
The site is in Italian language.
http://www.fmdx.altervista.org/articles.php?lng=it&pg=510
http://www.fmdx.altervista.org/articles.php?lng=it&pg=386
http://www.fmdx.altervista.org/articles.php?lng=it&pg=420

There is also a RDS decoding software at:
http://home.scarlet.be/~wijnherm/rdsdxdownload.htm

I have not done hany modification yet on my 1103.
Ciao, Dino

Hi,

you can use decoder in "files" with TDA7330 , signal for decoder is
from pin 19 of TA2057 via capacitor cca 15n.

Use EXTERNAL 12V power supply, not from computer comport! (It is
better...)

Attention!!!

For connection and cable to computer read:

http://home.scarlet.be/~wijnherm/rdsdxhardware.htm

Now you can use software RDSDX:

http://home.scarlet.be/~wijnherm/rdsdxdownload.htm

Software work very good, but you must use WIDE filter than 150kHz
in 10,7MHz IF in Degen!

Some picture of software for instance here:

From: Jara
Topic: 1631 Message: 1637

Hi all,

I use RDS decoder (home made with TDA7330) cca 2 years with software RDSDX. (Dell, pentium PIII, 550MHz, winxp).

It work very good also for FM DX from Italy, Spain etc... (I live in Czechia and I use HB9CV antenna or dipole for FM DXing)

Best regards, Jara Rat

1638. New Member/Owner Experience

Yahoo group: de1103
Date: 2008-06-01 13:03:18 UTC
From: skysensor
Topic: 1638 Message: 1638

I received a new DE1103 about two weeks ago, direct from one of the Chinese "big 2" sellers. Though I am a licensed ham, I am inactive, and I was looking for a radio mainly for monitoring world band radio. A form factor that eased use during my frequent camping trips would be a plus.

Following some internet research, I more or less zeroed-in on the DE1102 or DE1103 (or Kaito equivalent). I was concerned about the fairly negative comments/reviews about the 1103s ergonomics, and also considered the E5/G5. In the end, I ordered the DE1103 because even if I found the ergonomics to be truly objectionable, it ought to be easy to sell due to the positive reviews of it's performance. In spite of my reservations about ordering direct from overseas, I took a chance (as they say: "Columbus did, and they named a city after him..."). I have actually ordered multiple items over the years from the Far East, and have never had a problem, but I also recongnized that in an electronic device like the DE1103, the chances for issues were somewhat higher.

The package arrived, and I was surprised to find it packed in it's original box, in a padded airmail envelope (not double boxed). Though there was some very minor corner crushing (of the box) evident, the contents were undamaged. I was just slightly disappointed with the two light scratches (visible only at certain angles) in the display, as they might have been avoided by a protective layer of adhesive plastic commonly found on like products (but not on this one). With a display this large, you'd think it would be better protected "pre-consumer". Still, a minor quibble.

Popped in the batteries, plugged in the AC adapter (marked, curiously, 110V/50Hz). The clock displayed 0:00. Quickly adjusted the time, and hit the power button. Nothing. Again. Nothing. Found a paper clip, and reset the radio. Power button. Nothing. I pulled the batteries and tried the unit with AC only, unsure if the batteries must be present or not. No luck, and actually, the clock faded and disappeared.

Getting somewhat upset now, I put the batteries in my smart charger, where one of the four cells was not recognized (meaning: dead/dud/would not take a charge). So I replaced the supplied cells (cheap 1300 mAh units anyway, so no real loss) with some 2000 mAh hybrids on-hand). Radio powered up with no problem. I spend some time acquainting myself with the operation of the unit.

Eventually, I try to set the recharge timer. Unsuccessfully. Following the instructions, I am unable to get the radio to allow me

to set the timer. I suspect a problem with the radio recognizing the DC in. I remove the (good) batteries, and try powering the unit on AC again, but no luck. OK, so either a bad adapter or something bad in the DC in circuit. Unfortunately, I didn't have a matching wall wart (and couldn't find my multimeter), so I took a trip to Radio Shack to pick-up a universal adapter. Radio (and internal charger) functioned normally with the universal, confirming a bad adapter. Based upon other reports here, this is not an isolated incident. I emailed the seller, who stated he would send a replacement. We'll see how the new one works out when I receive it.

If the 110V unit was substituted for the original 220V prior to shipment, you'd think that the seller would take the opportunity to ensure it was functional before shipping it halfway around the world (I mean, it would be nice to achieve 100% quality, but that is a little unrealistic). Simple testing prior to shipping would have avoided some pain on my end (not to mention the expense of replacement on his end).

If the above sounds like a negative experience, I like to clarify by saying I'm actually quite happy with the radio. It performs very well, and honestly, I don't find the ergonomics in the least bit hostile. Just a few sessions with the radio and everything comes together. The only thing I can't understand is the default volume level (after reset): seems like it may be high enough to actually damage the speaker. I typically listen at a volume setting of 10 to 12. Can't imagine trying to listen in an environment that would require 40(!) to be heard.

If you've been considering the purchase of this radio, my advice is to sharply discount any negative comments you've read about it's ergonomics. They are vastly overblown, in my opinion.

Now looking ahead...how does everybody feel about the RP2100? :)

Mark

You must have read the review in Passport to World Band Radio or else calling the ergonomics hostile is an incredible coincidence.

I have the Kaito version, which I bought on eBay from a seller in the USA almost exactly a year ago. I keep reading about the default volume level "problem" but mine never did that or anything else wrong. My only gripe is that the grill is a bit flimsy. I handle mine very gently when taking it on trips but it has developed two dents in the grill. It is an incredible bargain. A few months earlier I bought a Sony ICF-SW7600GR. I thought I was happy with it until I bought the Kaito. I almost never use it any more.

1640. Re: New Member/Owner Experience

Yahoo group: de1103
Date: 2008-06-01 21:28:50 UTC
From: Gordon Cooper
Topic: 1638 Message: 1640

I have had mine since early February, and it is an excellent radio for its price point. It would be interesting to see what Degen could do with a radio that sold for $149.99.

As a southpaw, it is awkward to manipulate the jog dial, so I turn the radio on its side, or
just use the keypad.

What would be nice would be the ability to "define" a band between any two points in its range and have that displayed, so you could program a 30 meter, 40 meter band. That would make it a bit easier to dial in on data or ssb transmissions.

The speaker grill is a tad fragile and has gotten dinged quite easily. I've had to reset the
radio most times that I change batteries, and the volume does go to 40 on mine in a reset.

Here in Western Washington I get Australian, New Zealand, Japanese and Chinese stations on a regular basis. I do wish that the radio were better shielded, because a few of the am stations bleed through and appear on either lf or shortwave bands.

Any suggestions to fix the bleed through?

Thanks

Gordon Cooper
Bremerton WA USA

FWIW this may be difficult in some countries, I have found several
electronic items which the common consumer user has no clue what "all of
those numbers" mean as well.

Agreed on the volume, and after blasting my brains onto the floor, I now
ALWAYS check the volume before plugging in the phones O-o.

The ergonomics in my view are actually closer to perfect than many other
radios. My only complaints now would be:

1) need to follow instructions in the file section of this group for
seamless tuning. (The extend coverage instructions followed by saving a few
choice starting points and starting a "scan" from those)

2) would like computer to memory interface.

3) would like to be able to set a top and bottom and "scan" between those
looping at the ends.

I currently partly get around #2 and #3 using my Icom R5 on the same
antenna, usually gets me close enough to find what I am looking for. (now
lets talk about nearly unusable ergonomics ;) designed by drunken monkeys

and implemented by their hairless cousins in the same state of being)

1643. Button Lock

Yahoo group: de1103
Date: 2008-06-03 16:56:23 UTC
From: skysensor
Topic: 1643 Message: 1643

I ordered the fake leather case along with the radio. I've been irritated to discover three times over the past 2 to 3 weeks that the radio has been accidently turned on while in the case, indicating future potential to drain the batteries while in storage. I was thinking that it would be better if the power button was somehow recessed or otherwise protected.

Playing with the button lock, I was happy to discover that it also works to prevent the unit from being turned on, so this goes some distance toward eliminating the problem. As it is smaller, somewhat protected and requires more than a momentary touch, the odds of accidently disengaging the button lock and then powering on should be minimal.

Hi !
Thanks for your answer !
Have you any experience on Puskas Barnabas decoder and does it work
with rdsdx ?
http://home.pi.be/~wijnherm/deco.html

Connection to computer is in both decoders is bit strange.
Because the data is fed to D9-pin number 6.
Normally in D9(rs232) incoming data is taken to RxD.
In your model you have also used the pin 14 (TA7330), with
transistor/Led from D9-TxD signal, what this ?

Do you have a circuit board picture for your decoder ?

Yes, I also find the Lock button to be useful. Not much is worse than opening your suitcase after a flight and finding the radio turned on. Since I have begun to lock the radio prior to packing it, I haven't had a single repeat of the radio coming on during travel

I have bought two of the Degen 1103s. The first one was flawless. The second has a few minor problems. The charger supplied did not work, and a few of the squares which surround the frequency band you are in did not come on the display. The display problem is a minor irritant since you can figure out which band you are in by looking at the frequency readout. The charger is a Piece of Junk, and it is not worth returning it, since the cost of a new one is les than shipping it back to Hong-Kong. I do not use it anyway, preferring to use a good quality charger (LaCrosse) instead of a cheap time based charger. I prefer this radio to the excellent Sony 7600GR, since I love to using a rotary tuner. Enjoy! I have bought a third radio as gift, and will let the group know how the quality stands up.

I bought a Sony 7600GR about four months before I got my Kaito 1103. I've hardly used it since. The synchronous detection is a major disappointment. It is nowhere near as good as the Sony ICF-2010, which I've just started using again. There was a major problem with the display that I thought would be expensive to fix but I was able to fix it myself for free.

My only gripe with the Kaito 1103 is that the grill is flimsy. I try to baby my radios but after a couple of trips (stored in it's carrying case when not in use) there are two dents.

Hi !
As a matter of fact I now have experience on Puskas Barnabas decoder.
I am just testing it and works fine.
Quite cheap and easy to build.
4.332 Mhz crystal was bit difficult to find.
Finally I soldered it out from an demolished car stereo that had RDS.
Rdsdx-program work together with decoder nicely.
Important is to note that RS232 D9-connection is bit different
with rdsdx and other DOS-programs.
PC is Fujitsu/Siemens with AMD sempron and XP.

The grill on my DE1103 is the dull mauve color and when I received it the color had faded streaks here and there. It looked like someone used too much solvent to remove the glue used to cement the grill in place. After about a year, the grill started to separate from the case along the upper edge near the three buttons and around left hand edge near the middle. I'm just waiting for it to come loose a little more so I can use a pin to get some crazy glue or epoxy cement in there to fix it in place. I don't want to open it up, so I will wait until I can fix it from the outside.

I ended up getting a Pelican 1060 micro case to carry my radio. Actually I use it for my DE1107 radio (same size) at work. It has a clear lid so I can see inside if anything gets pinched when I close the lid, and I use a small mirco cloth inside for padding. It works perfect.

A follow-up to report the resolution of my issue with a bad AC adapter:

Once I was able to confirm the issue was, in fact, a bad AC adapter, I emailed liypn to report the problem. I received a response about a day later, apologizing for the problem and informing me that a replacement would be sent the following day. I received the new adapter (in the midwestern US) about 8 days later (approximately the same amount of time it took to receive the radio). The new adapter works as expected.

I'm very happy with resolution of the issue. I'm sure I would have been less happy had it been necessary to return something overseas, but that's the risk I chose to bear when deciding to purchase.

Yes, the wire wins, but it is very flimsy. I stepped on mine and broke
it. I am using the "Tiny Tenna" and indoor 40' reel, which works nicely
here in the Northwest.

I have mine running from my second story window to the fence across my tiny back yard, and this works better for me than the whip by a long shot. It picks up a lot of noise but that's to be expected here in the city especially with all the alley, street and stop lights nearby.

Out of curiosity, could anyone tell me how the wire in the antenna is connected? I'd like to make something similar but longer to try out in the countryside sometime. I'd like to see if I can get DX on LW with some 500' of wire. Is it just a single conductor connected to the center of the 1/8" plug?

Thanks.

You should have to use a balun to match impedances otherwise the receiver will overload badly and likely destroy the front-end FET. This happened to me twice. Do not forget the diode protection betwenn antenna and receiver!!

Mine handled signals when adjacent to two masts that carried about 6 local MW stations.

I would have thought that by adding the balun, if anything, with an improved impedance match, signals would have been stronger.

Thanks for the warning! I printed out and read the balun docs in the "Files" section. I'm unclear on how to connect the coax to the DE1103. What is the expected impedance on the antenna jack input? I've seen BNC-to-1/8" adapters before so if it's close to 50 ohms I can just use that.

Additionally, on an application like I described, with a temporary very long wire out in the country somewhere, I probably wouldn't be using coax at any point. What's the best way to go about that without risking damage to the receiver?

Thanks!

Kiwa electronics will install some audio upgrades to the DE1103 along with an FET that should protect the front end against many overload situations. Of course, simply turning off the radio and sticking it into a metal box with no antenna should protect it in most situations, but not all. Lightning is simply too unpredictable around small electronics. When I lived in Houston, we would have close strikes on a regular basis, and many of these tripped our fire alarms. You got used to it after a while.

I think according to radioscanner.ru's reviews the radio is made of de1103 with some adaptations from radioscanner.ru :)
For example: Avia band is the same that I made in my DE1103, just using morror channel (f_osc-f_IF = 0.1-30MHz, f_osc+f_IF = about 112-148 MHz). PL600 just has a normal display of a frequency of the band, has no good input pass filter. So, i think it is good radio like de1103 and has the same problems. :)

It might be. But Isuzu Aska is Honda Accord, Ford Maverick is Mazda Tribute, etc. There are a lot of examples.
Tecsun and Degen are two different manufactures (or departments), but PL600 is very similar De1103. It has the same technical designs.
Reviews say that the characters are not better then DE1103.

Hi,
I can take as a silly joke that Tecsun PL-600 is better than Degen DE1103!
I?m owner of both receivers and have some experience with a lot of radios.
Here is my first experience with Tecsun PL-600:
1. PL-600 works good on AM .
2. Relatively good sensitivity and selectivity on SW, MW, LW, similar to the standard DE1103 but still seems for me the reception little noise and not to much stable in comparison with DE1103 (especially by SSB).
3. FM reception is very poor - deficit of selectivity due to lack of narrow filters. (Inside only one FM filter !)
4.Good sound, friendly to operate.
5.My subjective comparison PL-600 to Degen DE1103:
PL-600 : 6 points
DE1103 :10 points

Awaiting your self-containedly experience independently of
promotion reviews.

Have a nice day!

> similar.

It might be. But Isuzu Aska is Honda Accord, Ford Maverick is Mazda Tribute, etc. There are a lot of examples.
Tecsun and Degen are two different manufactures (or departments), but PL600 is very similar De1103. It has the same technical designs.
Reviews say that the characters are not better then DE1103.

Hi!
You have translated the reviews... it's joke. :)
Thanks for your response.
Try to do follow:
0. Turn off your radio.
1. Press button "SYSTEM SET"
2. Press "0"
3. Press "3"
4. Press button "SYSTEM SET"
It must occur label "ON". In the top-right corner must be "03".
5. Turn on your radio.
6. Press button for selecting bands "FM-AM-LW" some times until you
have seen "avia". You can listening aviation band (about 112-137 MHz).

Other system codes:
Turn off the radio.
Press "SYSTEM SET" "nn" "SYSTEM SET"
nn=
00 allocating of memory, page:10 preset:50

03 activating of AVIA
09 step MW 9 êÃö
10 step MW 10 êÃö
20 allocating of memory, page:20 preset:25
22 test of the display.
25 allocating of memory, page:25 preset:20
28 On a display - 1000 (change by encoder). Probably - current load of accums..
29 type of power supply, 29 - battery, 28 - accumulators.
50 allocating of memory page:50 preset:10
55 off/on ? (not know)
76 bandwidth FM-band 76-108
87 bandwidth FM-band 87-108
88 bandwidth FM-band 88-108

translateed from radioscanner.ru/forum

Here are some info about the Tecsun PL-600
http://newsgroups.derkeiler.com/Archive/Rec/rec.radio.shortwave/2007-09/msg00020.html
The above info shown Tecsun PL_600 is a lookalike radio(yet doubtful if they are clones) to the DE1105 (producted years earlier than the DE1103)
In short the DE1103's design should not be identical to DE1105.
(and so does to the PL-600)
Hope this helps.

From: knyuen88
Topic: 1663 Message: 1675

Sorry, I mean DE1102 -- not DE1105 --- is a look-alike radio for
PL_600.
Also please see others reports for comparisons:
http://www.geocities.com/zliangas/DE1103.html

Well the main point I am making is that Degen and Tecsun are sister companies. This exerpt is from Radios4You web site..... The GRUNDIG G5 is the newest high quality world receiver made for GRUNDIG by the DEGEN electronics company which is the sister company of TECSUN and is one of the top manufacturing companies in China. It receives all of the shortwave frequencies, Long Wave and FM.
I thought this was common knowledge.

From: John
Topic: 1686 Message: 1686

Just got my DE1103 from "tquchina" e-bay seller I must say a perfect transaction. Prompt shippment and one of the best profressional packing jobs i've seen, triple wrapped in bubble wrap.
Came with:
110 vac adaptor/charger, Ear buds, 4-AA Degen 1300 mAH Ni-MH, wire antenna, nice small CD with manuals for all Degen SW portables in Chinese and English. Carry pouch.

Turned it on and 1mhz WWV came in loud and clear.. to be expected as I'm in the mountains overlooking Boise in SW Idaho.

Very impressive!!

Happy Summer Solstice Day to everybody.....and Good DX'ing

1688. Laptop Interference

Yahoo group: de1103
Date: 2008-06-22 04:56:03 UTC
From: spellboundnz
Topic: 1688 Message: 1688

Hello All

I'm a new member here, just joined up a couple of days ago! I recently purchased a DE1103 to use a SSB reciever for voice and Fax updates.

I have fax software on my Laptop and it works fine, however when I plug my DE1103 into it there is a massive increase of interference.

I had an old Toroid lying around and I tried that it made a slight difference but not much, is there anything else I can do?

Thanks for your help.

SHANE

See "Photos" area album "antenna's" "receivertocomputer 1 & 2"
Connecting the laptop to the receiver

Audio
receiver computer

best line out/record line in a
2nd best line out/record mike 1
next best headphone line in b
better not headphone mike 2

a Volume control independent. You can listen.
1 Volume control independent. You can listen. Soundcard PC may get oversteered.
b Volume control dependent. You cannot listen. Soundcard PC may get oversteered.
2 Volume control dependent. You cannot listen. Soundcard PC may get oversteered. Also see extra info about volume control.
Most laptops don't have a line in, just a microphone in.
Use a good quality audio cable. Length max 2 metres.
Do not change PC line in and Headphone!

Remote control
See the receiver's manual. The cable probably is an RS232 nullmodem cable (TX - RX and RX-TX).
==========
Audio volume control and transformer

The windows audio volume control is not very practical. A simple controller in the audio cable does better. It is easy to make and does not cost much. All parts are obtainable from electronic components shops.
1 BNC in. Isolate from housing!
2 Audio transformer
3 Potmeter 50 kW logarithmic
4 BNC out
Use a metal housing (for shielding).
The audio transformer prevents disturbance from the computer reaching the receiver. Preferably 1:1, 70W impedance.
X Seperate groundings!

From: David
Topic: 1691 Message: 1691

Sorry to visit this issue again because I know I have seen it on the site but I have searched this site and eBay but no luck. I need a whip antenna replacement for my KA1103.

I have seen links posted before but could not find any today. At one time I saw them on eBay for $8.95 but did not need one at that time. Is that not always the way it works?

Any links would be appreciated.

Thanks.
David (KA4MIW)

Thanks for the information, it was very helpful.

The other thing I notice is that receptoin ss very poor untill I remove the antenna cable. When I remove the cable and have the antenna plug halfway out of the socket I get fantastic reception with very little interferrance.

Any idea why this is the case and how I can resolve it?

Thanks

Sounds like a ground loop problem, with the plug halfway out the ground
isn't connected. A transformer would help.

Thanks Leon

It that a transformer on the antenna or on the power supply?

Thanks

Topic: 1701 Message: 1701

I am actually pretty new to the hobby as well. I live in Georgia (USA) and I have done a lot of research regarding worldband receivers over the past 2 or 3 months and finally decided to jump in. From all the reviews I have read, the 1103 looks like a good unit to get started with.

I received the radio in the mail yesterday and proceeded to read the manual, pop in the batteries, and begin with the intial setup. Surprisingly enough, I found the manual to be quite friendly and not as complicated as many have reported. Perhaps because I have nothing to compare to. I ran a quick test of the FM stations and was very, very pleased with the reception and sound. I didn't play around too much because I knew I had to get the radio charged. Based on the calculation in the manual I set the charge for 12 hrs. Low and behold, the battery charge indicator did not strengthen when the charger automatically turned off. It looked like it was charging, the volume bars were "running" and I could check charge time left and time passed, the backlight remained on.

I have read through the past posts and there appears to be a history of power supply and battery issues. Some say to get new batteries, some say get a new power supply, and some say to get new batteries and a charger. I am sure I will try each of these until I figure it out. But I do have a few questions;

Is there any risk associated with charging the batteries in the unit as opposed to an external charger?

What are the stongest batteries that should be used. What strength batteries are recommended?

I am sorry if these questions seem too basic, I will continue trying to research before asking.

Thanks!

Hi

Welcome, as I don't use the internal charger I cannot answer your first question, I live in New Zealand where the mains voltage 230 Volts so the charger is of no use. As far as the batteries go, they are all 1.2 volts. I would get batteries with the highest current rating, 2500mAh ones should last quite a long time. It depends of course how often you use the radio.

When you are tuning on medium wave, don't forget to look out for any station using a 9 kHz split. Knowing the performance of the Kaito on medium wave, it is highly likely that you will hear something.

Hi,
I recieved my 1103 last week, I found the batteries would not charge ,I placed the batteries in another NiHm charger still they would not charge. I placed Nihm I bought in the radio and they did charge for me the batteries were at fault.

I advised the supplier and they gave me a $10 refund which I am happy with.

I am very happy with the radio as it is pulling in AM and FM stations never heard before.

A great reciever but very poor quality supplied batteries.

Most common procedures:

1)Use of external charger for NiMH batteries is recommended

2)Do not play too much with the telescopic antenna, it tends to broke or disengage in its segments, as reported. FM reception is excellent without need of fully extend it, depending on the location you are.

3)Beware of the static electricity in your body when touching the telescopic antenna. Assure yourself to touch any metallic surface to ground whenever you have dry (and windy) weather. (Although I don't know if the latest production units are already front-end protected.)

4)If you want to connect large wires to the receiver as antenna for SW reception, the receiver will likely overload. Use a inductive coupling to between antenna and receiver (balun.. to adapt impedance). The possibility of burning the built-in RF preamplifier in the receiver is increased, for signals are stronger, and especially be careful with external antennas in local electrical storms, disconnecting them at all.

5) In MW the receiver uses the incorporated ferrite bar antenna. If you want to use an external antenna to receive MW and the receiver not using the ferrite you have to implement the "receive below 100 Khz mod" explained elsewhere in this group.

We are here to share experiences and friendly be helpful on what we can. The 1103 is an excellent receiver. If your local noise is not problem you will enjoy it greatly. Remember we are on the Low Activity Solar Cycle, so HF bands are suffering poor propagation, mainly at daytime and in higher bands.

I wish you best 73 (=greetings in the radiofan, ham, telegraph argot) and many DX (long distance contacts)

1705. Re: [de1103] New Member with just arrived Kaita KA1103

Yahoo group: de1103
Date: 2008-06-26 12:28:14 UTC
From: Paul
Topic: 1701 Message: 1705

I was out and about the other day tracking down transmitter sites of our local MW stations, I was a 200 metres away from one mast and about 500 metres away from another. The KA 1103 handled the high signal strengths (there were six stations sharing two masts) with no problems. I was also able to hear the signal up to the 15th harmonic on the one that I tried.

As far as the whip is concerned, it is a good idea to carry a spare. I ordered one the other day just in case.

During an electrical storm it is a good idea to disconnect everything including the computer's modem from the phone line.

If you are using a loop antenna for MW, all you need to do is to place the radio within the loop and the inductive coupling between it and the radio will work just as well as if the radio was hardwired to the antenna.

Gidday Paul,
I live over the ditch in Sydney , the internal charger works Ok with new NiHmBatts us Ozzies also use 240volts so I reckon the supplier charger should be OK.

Hey mate Kiwi land is a beautiful place I am looking forward to get back to the South Island for fishing and sight seeing.

I reckon you Kiwi guys are good blokes.

Bye

From: jsphipps
Topic: 1701 Message: 1707

Thanks for the response.....I will take your advice and purchase the 2500mAh batteries. I hope it fixes the second problem I encountered as well. I went home last night, plugged the radio in so that I could begin testing the MW-SW functionality. I immediatley turned the dial to a local AM station and got a very clear strong signal. Then I decided to test the search function....that's when my trouble began. For some reason it would not lock in on any AM frequencies. I watched it go through a couple of cycles then tried to manually tune into the frequency I was listening to earlier. No go. It seems that the radio will not pick up any MW or SW frequencies at all. FM still works fine. Resetting did not help. Not sure what to do yet but I unplugged the unit, took out the batteries. Today I will purchase some new batteries, and see if that has anything to do with the problem. I hope so.

Thanks for the advice. I will be trying new batteries today. If you
read my reply to the other group member you will see that I now have
the problem of not being able to get AM-SW to work at all.
Hopefully, this is all related to the battery issue. If not, I guess
I will have to send it back.

Hi Dave

I got mine via Amazon which explains the voltage mismatch. I must have been lucky as far as the batteries go as I have had no problems. The same cannot be said for the charger that I have. It's one of those energiser four cell ones, and judging by the amount of use I can get out of the digital camera between charges, I don't think it is doing its job properly.

The South Island certainly does has plenty of nice places to visit, and if you are into skiing, the way things have been shaping up, it is going to be quite a good ski season.

I've had no problems charging the supplied batteries in the radio.
I've always selected the maximum charging time regardless of battery
state without a problem.

From: jsphipps
Topic: 1711 Message: 1711

Well, yesterday I bought some new batteries, charged them up and put them in the radio which had been sitting powerless for a few days. The unit still indicates that the batteries are not fully charged and I still can't pick up any AM or SW frequencies. I guess I got a lemon.

Thanks for all the advice, I will join you again and let you know how everything works once the replacement has arrived.

Try the reset button on the radio. Then let is sit for a couple of days before re inserting the batteries.

When you put in the batteries, make sure the connection is good at the ends of the +/-, and ensure the correct polarity. I've seen a post in the past where the AA batteries supplied with the radio were just a tad too short in length, and a good connection was not being made.

I think it is the transformation ratio....
Any extension is not common.
My opinion is that a transformer with the ratio 1 : 1
will works as well..often found in out dated computer-telephone line
interface's.

From: wind_nv
Topic: 1715 Message: 1715

recently I've made a small mobile antenna for my DE that can be mount on a window or balcony or car via a pipe and Windshield Suction Cup for PDA (or any strong cupule).
The antenna uses a amplifier (source follower) that has a big rate of power gain. The schematic is http://www.radioscanner.ru/uploader/2007/pa0rdtminiwhip.pdf (in english)
Excellent result! I easy pack it to pocket, easy mount, can listen to all MW and SW waves.

Topic: 1701 Message: 1716

For what it's worth, when I first got my 1103, I just put in ordinary AA alkalines and it worked fine and I have just been using that type of battery and the external power supply/wall-wart ever since. I get the impression that the radio is unhappy with having no batteries or nearly-dead batteries in it, even when it has power via the external jack, so just change the batteries when they're low. The whole bother of charging rechargables seems to be not worth the effort. I did check out the NiMH ones that came with the radio and they did seem to be somewhat flaky, even when charged in an outboard charger.

Since I leave the radio attached to the external power supply 99% of the time, the regular alkaline AAs last for a long time so the expense is trivial. This also means that the radio will work reliably at those times when I do unplug it and use it portably; no danger of a weak or run-down rechargable dying unexpectedly and interrupting my use of the radio. I keep an eye out for sales of AA alkalines, especially in large-quantity packs, and keep a good supply at decent per-cell prices for all the toys I have that use them.

Topic: 1717 Message: 1717

Hey folks,
it's just now, that I realized via the manual, that the external antenna is meant to lead somewhere outside. (I really don't know too much about the technics)
Right now, I have it around the ceiling inside the room - and yeah, the reception isn't soooo much better.

My question: Is that cable really weather proof?

Best regards
Jens

P.S.: Some people might remember I had bad luck with my first receiver. Well - the second one just works nicely. tquchina really is the best on eBay.

http://www.radioscanner.ru/receivers/review/degen1103_eng.html

There is more info on that site, e.g.:
1) put in google "radioscanner.ru".
2) search "the web".
3) 9 out of 10 the the first hit is radioscanner.ru.
4) "Translate this page"
5) Wait for a moment....
6) Scroll down a bit...
7) click on "Files"...

From: legonedijk
Topic: 1717 Message: 1719

Hi Jens,

That antenna is more for temporary installation.
Let say on a holiday trip for excample.
There is special antenna wire for sale.
My opinion is that every cupper wire wil work as an antenna.
Dig out the scrabbox in the cellar for example...or go to a
building site....
It is great fun to achieve an improvement at low costs.
The only investment then is time.
Read and study a little, e.g. by wikapedia, about the antenna
technics.

Make sure that the antenna is disconnected from de 1103 when not in
use.
Also take care of man made static electricity. Discharge yourself
by touch a big peace of metal or an earth / grounding connection
before you touch the whip antenna.
Static electricity is made by dry frosty winds and ofcourse also by
thunderstorms.

B.t.w., my dictionary drop out in bit and pieces....

Plan of a simple Inverted L Antenna

http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=3275

Don't worry about any length mentioned in the plan just build it to fit the space you have.

Attach a 3.5 mm mono jack plug to the down lead and plug this into the radio or wrap the bare wire around the telescopic whip.

As far as the type of wire to use, you can use any multi strand wire preferably copper because it is a better conductor. Just make sure that it will be strong enough to withstand the forces of the wind. These is no need to worry about weather proofing the cable.

The only part that you may have problems obtaining would be the porcelain insulators, anything that can do the job would be ok.

As Jan said, research the web, go to your local library for information. An antenna is something that you can build for yourself without the use of a specially assembled kitset.

1721. Re: External antenna weather-proof?

Yahoo group: de1103
Date: 2008-07-05 20:07:16 UTC
From: setijens
Topic: 1717 Message: 1721

Hey you two,
thank you for your suggestions. However I'm all thumbs regarding electronics and messing around with it. You wouldn't believe how proud I was to finish the Enterprise NX-01-Model with electronics included (quite easy model - no glue and painting required) :)

In addition, shortwave is just one of my several hobbies - I want to play around a bit, not more and not less.

I also bought a DE31 active loop together with the receiver, but didn't really notice an improvement in reception. Same applies to the long-wire antenna. Maybe it's because of my rather good position - 1st floor, old building and therefore probably not much shielding.

Any commercial antenna for reasonable prices, that could further improve my reception?

Best regards
Jens

1722. Re: External antenna weather-proof?

Yahoo group: de1103

..."Oh..oh..beam me up Scotty, that man is underestimating himself!!"

Hi Jens,

A lot of us, owners of a 1103,are starters in DX-ing (receiving).
I am a starter also and now capiable to decode NAVFAX for example.
A PC or laptop with a decoding program are the supplimenting tools.

Compare prices is great fun....
http://www.pyacht.com/online-store/scstore/h-sitex_navfax_200.htm

Lesson 1
The active loop is a directional antenna.
That wire antenna what comes with the 1103 is nearby omnidirectional.

Lesson 2
The loop is for receiving the magnatic part of the radio signal.
That wire antenna is for receiving the electric part of the radio
signal.

Find a station with a lot of disturbance on the whip and wire antenna.
Than connect the loop to the 1103 and turn the loop to different
directions.
Hopefully you find out that the signal is much clearer.
The strengh of the signal, audio, is less.
That's what we want...quality and not quantity...

Guys, if i had made mistake's correct me.

Sorry for my 2 penny english...

Reg.: jan

From: Steven Beesley
Topic: 1723 Message: 1723

Hi,

I just saw your loop antenna in the photos sectio, are there any details for the transformenr, VR and resistor in the tuning control? Would like to try and build one =)

Regards,

Steve

1724. Re: legonedijk : Details on Your Loop Antenna

Yahoo group: de1103
Date: 2008-07-06 10:09:01 UTC
From: legonedijk
Topic: 1723 Message: 1724

Hi Steve,

There is no transformer.
VR?....no....resistor?...no
Only a varable capicitor of, this is a gues, appr.350 pico farad (pF)

In the top of the big loop is the smaller coupling loop.
Nothing more than a peace of cupper wire diameter
appr.30 cm / 1 feet.
One end to the inner of the coax the other end connected
to the shield / outer of the coax. This coax to your
receiver. Mayby you need a 3.5 mm jack-male for this.

The big loop 82x82 cm /2.6x2.6 feet ,appr., is made of pvc-tubbing.
Inside the tubing is a cupper wire.
At the bottem the ends of that wire are connected to the
varible capicitor.

B.t.w., you don't need a coupling loop....see
photo "coupling_without_wieres" in the "Photos-Atenna's"section of
this group.
The coupling now is done by ferrit antenna bar inside the receiver...
(or is it the whip antenna?)

Guys, correct my if i made same misstaks...

Hope it helps a little.....

Reg.; jan

1725. Re: External antenna weather-proof?

Yahoo group: de1103
Date: 2008-07-06 17:03:43 UTC
From: setijens
Topic: 1717 Message: 1725

Hey Jan,
your english is just fine - so far, I understood everything.

I tried to move around the active loop antenna, and I indeed noticed, that the reception changes with the direction of the antenna. However - even with the best possible direction, I won't really have better results, than with just using the whip.
Is it possible, that under some circumstances rather cheap antennas won't make too much of a difference? I also owned a used ATS-803a shortly, and with that I also couldn't notice any difference, when attaching a cable to the whip, than without the cable.
For testing purposes, I tuned into a not so strong SW-station and listened, if the signal becomes clearer. Or is that the wrong method of testing?

Is it possible, that besides rather complicated/expensive antenna constructions, I already get the most out of my receiver?

Best regards
Jens

P.S.: Yeah, sometime I'm going to test the stuff with weather faxes as well. Just have to get some audio-connection cable.

Topic: 1717 Message: 1727

Hi Jens,

There is a difference between your area and my habitat i think.
I live in an appartment, 10 mtrs / 33 feet above sea level.
The man made noise and radio frequency interference is hudge.
Beside that the only glass-window of 11. mtr / 38 feet is on the south side.
I live nearby in a cage of Farady.
Very difficult to recieve the electricity part of a radio signal.
The positive side is that the Farady cage is not disturbing the magnetic part of the radio signal.
With the loop antenna i am capable to "nul out" the interference.

You wrote: "I won't really have better results, than with just using the whip."
Then you live in a "clear" area. Congratilations!!!!

Your testing methode is ok.
==========
ATS-803A:

Performance
The 803A is a real rugged workhorse with solid performance. It is an exceptional performer in the MW band.

MW - performs very well with both the internal loopstick antenna and with an external antenna.

SW - overall fine reception. Like most Sangean radios, the 803A is a little on the deaf side with just the whip antenna (I wonder if that is why they provided such a long whip?). An external antenna really brings it to life. Sideband/cw reception is average with the BFO tuning arrangement. One very nice feature of the 803A is that the wide/narrow filter works in sideband - this is not always true in shortwave portables. Stations are easily received all across the SW spectrum with a modest length external wire antenna.
==========
The DE-1103 is slightly different but needs a external wire antenna also in most cases.

You wrote:"Is it possible, that besides rather complicated/expensive antenna constructions, I already get the most out of my receiver?"
That all depends on the time of the day, atmosferic interference and propagation and.....HAM experience!!!!

If you go for WETHERFAX / NAVFAX than you realize what a nice little thing the 1103 is.

That was it for to day.

Hi Dmitry.
No I didn't. Because I don't have the DE-31. But, I did some magnetic loops in different variants and I always was not satisfied with results, it was very noisy in resonance or very small signal, so, I prefer only electric antennas instead of magnetic antennas.
But, I want to try my hand-made not resonant magnetic loop with that amplifier. I think it will be the same or worse, but bigger and not pocket).
DE-31 is needed to tune on a frequency, I don't like this. I would prefer to make a preselector with an amplifier and make an outdoor antenna.
My AA-antenna is a outdoor telescopic antenna of DE-1103. It works a bit better than native telescope of 1103, because DE-1103 has a source follower too.

Since I got my 1103 three weeks ago, I have tried the long wire antenna with excellent results over the already very good internal whip.

QTH: Boise, Idaho in the foothills to the north of the city at about 3200 feet.

A new town with underground utilities and not much noise level, surrounded by low mountains.

EU dx'ing is very good and of course Asia is perfect, so is central America and south America.

I have tried Degen's active window antenna DE-31? with very poor results and sold it. The long wire is very good.

At last, someone using a traditional antenna, I just wish that I had the space. A lack of noise would be nice too .... don't forget the South Pacific, Radio Australia, various low powered tropical band Papua New Guineans and Radio New Zealand International http://www.rnzi.com/index.php. You could also try going for Asia/Pacific stations on medium wave, just check the 9 kHz splits. If my experience is anything to go by (hearing stations from the opposite direction), you should stand a very good chance hearing something using just the built in ferrite antenna.

Good DX

It's very interesting! Thanks for the info, I tried to find simple schems too...
But there is one small problem... The "existing replaced diode" is built in TA2057 of DE1103 :) in mode AM. The detector could be used in SSB mode.. between 18 and 17 pins of TA2057.. but then it's need an additional commutation in order to exclude SSB detector.

1735. DE1108 teaser?

It seems to me that the de1108 is Tecsun PL-600. Because, DE1108 was planned in 2004 to be made, and both Degen and Tecsun are one hangar, so DE1108 became PL-600. :) They are similar with specifications.

1737. Re: DE1108 teaser?

I don't think so. While Degen is a subsidiary of Tecsun, they have a different product line. Also the blurred photo, and the sharp one below it are from the same radio. The sharp photo of the LCD/AGC/tone control/clock/signal meter shows a part of the radio, which appears in the blurred photo (middle to left), and the right hand side of the radio is apparently a direct entry keypad. Overall this appears to be a large radio, not a small portable.

1738. Newbie (to Degen 1103) with Questions

Yahoo group: de1103
Date: 2008-07-18 03:45:51 UTC
From: mal1958au
Topic: 1738 Message: 1738

Hi,
I am a newbie to this group, but a bit of an old hand to radio.

I recently purchased a Degen 1103 and have had a bit of play with it.

It certainly lives up to it's reputation for bang for buck with
regards to performance (Sensitivity etc).

There are two things though that I would like the considered
opinion of the group about.

a) The supplied Degen Ni-MH batteries.
When I initially installed the recharge-able Degen batteries, the
battery indicator came-up showing low charge. Fair enough, so I took
them out and put into my Ni-MH charger.

The charger charged two batteries OK, but had error lights on the
other two. The two batteries with error lights showed 1.0 V and did
not seem to want to initially charge. I don't know why, but later
when I took them out and when I tried to charge them, they were
charging OK, with a reading of 1.3V.

When they were all fully charged ,I put them in the radio and they
lasted for about 15 minutes before the low battery indicator came on.
A check showed one of the batteries down to 1.0 V, the other 3 were
showing 1.3 V.

At this point I ran out of time to play more, but I did put the one
with 1.0V back in the charger and this morning it apparently re-charged.

My question about this is,

Is this typical of the quality of the Degen Batteries ? If so, I
will simply get a new set of quality recharge-ables to use.

b) Storing Frequencies in the Memory
While exploring the capabilities of the radio, I decided to store
some frequencies in Memory.

I worked out how to do this Ok, except that every time I wanted to
store new frequencies, it would always default to wanting to store the
new frequency in Memory 00. To overcome this, I had to scroll to a
vacant Memory location for the new frequency.

My question about this is,

Is this the way it works, or is there some trick to store the
frequency in the next free Memory location ?

Cheers
Mal (from OZ)

They seem to be rather variable, mine were fine. Yours sound as if they are
faulty.

I got the crappy green batteries also; I just simply use other
nimh's or alkalines. Not going to complain too much since
the radio is such a steal!

I've had my Kaito KA1103 for a little over a year. The battery icon shows only one segment all the time, even when the stock batteries have just been charged. They're about 1.4 VDC after charging. If I put in alkalines (about 1.6 VDC when new) all of the segments are shown. There is no performance difference between the two kinds of batteries.

1742. Receiver board control

Yahoo group: de1103
Date: 2008-07-20 13:27:55 UTC
From: K
Topic: 1742 Message: 1742

External control of the receiver board appears to be relatively possible, potentially expanding the frequency coverage.

Signals conducted on the 13 conductor Sony flexible ribbon cable are: (pin 1 is closest to the chamfered end of the cable socket)

pin 1 PWR_CTRL: active high
pin 2 AGC: analogue
pin 3 WW: analogue, volume control 0 to 1.25 volts
pin 4 CE: digital
pin 5 V_DET: digital, high (6VDC) if A/C adaptor present
pin 6 DI: digital, data in
pin 7 CHARGE: digital, high to enable battery charging
pin 8 CLK: digital, shift register clock in (40kHz, 20% duty cycle)
pin 9 Vdd: 6VDC power
pin 10 DO: digital, data out
pin 11 ground
pin 12 WIDE/NARROW: digital, high on wide
pin 13 SSB/ST: digital input/output, low in AM for SSB selected, low in FM if FM stereo detected

referring to the DE1103 schematic and
http://www.semiconductor-sanyo.com/ds_e/ENN5743B.pdf

CE, CLK, DO and DI connect directly to the pins of the LC72137M and are: 3.0 VDC active high and 0 VDC active low.

DO is capable of sinking 1 ma and has a 10k pullup resistor to 3 VDC. When CLK is inactive, it follows the station detect output of the TA2057.

BO1 toggles between enabling the AM RF/IF and FM RF/IF front ends.

BO2 toggles between enabling the MW and SW RF front ends.

BO3 enables the BFO in AM mode and selects MONO/STEREO in FM mode.

BO4 enables the 2nd IF oscillator in AM mode.

IO1 as an input follows the station detected output of the TA2057 and controls muting as an output.

IO2 IF counting by the LC72137.

3.0 VDC (regulated) is present on the wider trace just above the chamfer of the Sony flexible ribbon cable socket.

1743. Insensitive DE1103; 100-kHz-mod; ser.no.

Yahoo group: de1103

From: df8dq
Topic: 1743 Message: 1743

Hi, dr group members.
Frequently I read about insensitive 1103s, having lost their Q1-FET.
What does insensitive mean (whithout lab'measuring)?
I owe a DE1103 for 2 yrs or so, being quite happy with it. But I do not really think my radio is the "big ear". Well, depending on the conditions here at NW-Germany I can hear on 14 MHz SSB hams from all over Europe, and a crowd of broadcaster on 6, 7, 9, 11, 13, 15 MHz, but my 20 year old Sangean ATS 803a did this, too. And the Sangy did receive BC like Tashkent/Uzbekhistan on 5025 or Africans around 4800 and South Americans in the same tropical band with a whip, but the 1103 does not at all. Or Citizen band 27 MHz, Sangy does, Degen wont. Comparing the Degen on whip/w built in amplifier to Degen on 'long wire 5 meters': the wire without the built in amp. beats the socalled supersensitive whip/w amplifier Q1. Or should it be, my HF-Amplifier Q1 did never work ok? Above 20 MHz there's nothing....
Few weeks ago I did it - I made the 'down <100 mod'. The result: a big question mark. I did tune down to 77 kHz, memorized it. Hardly can hear DCF77 time signal station on 77.5 kHz with coded weather information, but ! longwave broadcaster on 153, or the BBC on 198 kHz, Luxemburg on 234, who always had been week on de1103, are gone. Even a regional mediumwave station on 549 kHz 100 kW, strongest on the band in normal mode, is hardly unaudible using the mod. I think the magnetic loop has been switched off, by there is no reaction to the whip or longwire ? Only less 'palm of my hand-sensitivity' regardable.

My serial number is, hope I remember right, AI026765, or like this. (what does is mean? Built in 200_2? or in 200_6 lot 765 ?) When delivered from China it had the round ChinaRadioInternational sticker, so it should be a 'newer series' - past 2004/2005.

No question, on MW and FM/FM-Stereo, the Degen 1103 beats every radio I ever used in 30 yrs of swl-ing and ham-ing (Grundig, Nordmende, Sangean, HBATEC) and is a competitor in SW-Reception on good antennas to ham eq. YAESU and ICOM. But as a whipped portable and holiday receiver - quite nice, but the king ??

Mine is just about as sensitive on HF as my large Redifon R551N
communications receiver and my FT-817ND and FT-897 transceivers.

Pass filter of DE has a roll-off of gain (amplitude frequency
response) after 12-14 MHz. Find the translated topic on
radioscanner.ru for improving.

1748. protection for Q1

Yahoo group: de1103
Date: 2008-07-23 23:46:51 UTC
From: Moisés Knochen
Topic: 1748 Message: 1748

I have just received a spare telescopic antenna from Tao Qu in order to replace the original one which is now loose and prone to fall apart at any time. Having the radio open with the guts exposed, I was thinking that this was a good oportunity to add a little mod to protect Q1, something like adding a couple of 1N4148 diodes. The most accesible point seems to be the whip itself which has a soldered terminal. However I'm unsure as to whether this would protect also the external antenna jack.

I am not sure either if the only circuit diagram available (obtained from radioscanner.ru) is representative of my sample (a Mk IV version).

Thus, before heating the soldering iron I would like to hear other opinions and also to receive some input about the differences existing in the front-end between different versions of the circuit. Does anybody have the circuit diagram of the Mk IV?

Thanks in advance

Moises Knochen

Yes..

> I am not sure either if the only circuit diagram available

> from radioscanner.ru) is representative of my sample (a Mk IV
version).

because the external antenna jack is connected to whipe in MK IV
version.

I have uploaded a picture of the new band pass filter -
IrisBPF_DE.gif (see also schematic diagramm of DE)
(See section File)
You are need:
5.6 pF - 1
15 pF - 1
22 pF - 1
130 pF - 2 (It can be two: 82 + 47 pF as I have made).

330nH (0.33uH) - 2 (I've made myself: 11 turns 0.5Cu 5mm diametr)

First:
See pic - http://www.radioscanner.ru/info/radio/degen2/020.jpg
make this.
Second:
http://www.radioscanner.ru/info/radio/degen2/021.jpg
replace L105 on 330nH
Add a new 330nH. Place the 15pF in parallel (not shown on the pic).
Third:
http://www.radioscanner.ru/info/radio/degen2/022.jpg
replace C132 on the 22pF, C135 on the 130pF,add a new 5.6pF and new
130pF as it's shown on the pic.

Check circuit.

1752. SW Reception

Yahoo group: de1103
Date: 2008-07-24 18:39:17 UTC
From: Tim Dale
Topic: 1752 Message: 1752

I just purchased an KA1103, I was told it was the same as the DE1103. I am trying to tune in SW stations, but I'm not finding many, and the few stations that do come in are weak. I'm using the supplied long wire antenna. FM comes in great and AM comes in okay, but when I go to the SW bands, there is very little to pick up, maybe 5 stations on all the bands combined. Do I need to return the radio? or is this radio just not good at SW reception?

It should be very sensitive, bringing in lots of SW stations on the whip
antenna, especially at night. Yours might be faulty.

Hi Tim

It depends on the time of day and the time of year, I'm assuming you are in the Northern Hemisphere, daytime reception is not very good during the summer. Night time reception will be better. The position reverses during the winter when daytime reception is better than night time.

Thanks for the replys, I made sure the switch was set to "DX", and I tried both wide and narrow settings last night. Still the same results.

Oddly when I could tune in a station, i would remove the long wire antenna and the reception was about the same with the telescopic antenna. It was a little stronger with the long wire antenna, but there was verry little difference in sound quality.

I was able to tune in about 10 stations throughout the SW bands last night around 10 P.M.

Anyone near central Texas that can give me a few times and frequencise to listen to tonight? I'm thinking something is wrong with my radio and I just want to verify that it's not working correctly before I return it for a differnt radio.

Tim: The atmosphere conditions can not be the same the whole day. Even in winter and summer. You must be able to listen many shortwave radio stations during any lapsus of time of the day: in the morning, in the afternoon or at night. In spite of the general conditions of the sky there must an opening during the whole day. Even if it is an small opening.

You have a shortwave radio station in Alabama, near Texas. The WEWN. The station broadcast schedule in english is:

0000 - 0559 = 11520
0600 - 0700 = 7570
0800 - 1000 = 9355
1100 - 1300 = 11560
1400 - 1800 = 15855
1900 - 2300 = 17595

I believe the broadcasting time is the GMT or UTC. But you can try using the EST. I show you different times so you can try all of them. I hear this radio station in Panama, all year long, using only the whip antenna. There are times, of course, in which the signal is weak or very weak. But I do not remember any null signal for more than two days.

If I were you I will send back the radio. This little marvel is so good to catch only 10 stations in one night.

Please, pardon my english writing.

Best regards,

Carlos

There is a learning curve to SW listening,. At night most stations will be between 5800-6200, and more in the 7 meg band. I suggest you pick up a copy of Passport To World Band Rqadio which ocntains an exellent primer for SW newbies. It's a great reference.

Others have already mentioned, and you replied on the DX/local switch so
I will leave that alone ;)

I personally have found the included random wire to be less than good on
a good day and worse than bad on a bad day. I have relegated them to
use as a cat toy. I believe in both cases (maybe all cases?) the
jack/plug on the radio/antenna is in some way not up to snuff because I
can wiggle the plug and get decent reception but never good reception
with the wire.

On one of my two [de1103] radios I have gone so far as to remove the
whip and hardwire a coax stub with BNC connector for use strictly at
home with my collection of homebrew antennas.

Also try www.primetimeshortwave.com, which has recently-updated listings
of programs in English. I've gotten pretty much everything listed on
there--halfway around the world at times--on the DE1103 with the whip.
I'm on the east coast but you should hear lots of stuff with a properly
functioning radio at your location.

1763. DE1102 vs DE1103 ???

Yahoo group: de1103
Date: 2008-07-27 00:25:47 UTC
From: radeohedca
Topic: 1763 Message: 1763

I wonder if anyone owns both the DE(KA)1102 and DE(KA)1103 and would be kind enough to provide a comparison of performance and features ?

i.e., is the 1103 a better receiver ?

Thanks.
Hugh VA3TO/NA3TO

Excellent comparative reviews of both (and more radios) are by Phil, under the file section of his Yahoo Group at http://groups.yahoo.com/group/phils_radio_articles/

In short, yes, the DE1103 is a better receiver.

1767. DE1103 and FM transmitter

Yahoo group: de1103
Date: 2008-07-27 16:21:05 UTC
From: setijens
Topic: 1767 Message: 1767

Hey folks,
just in case someone had the same idea, that I had - connecting a FM-transmitter to the headphone or line-out jack, and use an MP3-Player for recording - here's a small report of my experience.

To make it short: It's not really a good solution. I tried many frequencies, but it always produced lots of interference - although some other experienced DXers said, they didn't have problems with that and used this method. Might be a DE1103-specific problem or it might be the wrong transmitter, but using an audio cable really should be a better solution.
Oh and on the first glance Audacity really seems to be a nice freeware tool to do the recording.

Best regards
Jens

1768. Re:DE1102 vs DE1103 ???

From: Gary Sargent
Topic: 1763 Message: 1768

I have both .. and both are fine radios, especially for the price.

A few of the things important to me are:

1. The 1102 is smaller, almost pocket size. Sometimes this makes me use it where that is significant.
2. The 1103 has the tuning knob .. which I much prefer over simple up-down tuning buttons.
3. The 1103 has a slightly wider tuning range.
4. The 1103 has the much discussed fake analog tuning dial, which I generally like. I can have frequencies set for each of the bands and then jump to them as I go from band to band. Also, many of the ham bands also fall within these displayed bands, which is useful for the same reasons.
5. Others may disagree, but in my book they both receive about the same (I'm maybe less discriminating than others). Both are very good on FM.
6. The 1102 seems more robust and solid. The build quality on both is very good.
7. The 1103 allows tuning in the SSB mode on any band/memory, the 1102 only allows SSB on one memory bank.

If I had to pick just one, it would be the 1103.

Good luck!

Phil goes into a lot of detail in his reviews of boths radios (actually he recommends both) which you could read about. The DE1103 is more sensitive, and the SSB function on it is easier to access, among othe reasons. The 1102 is a good travel portable.

Quote from his review: "The DE1103 is better for DX due to its sensitivity and overload immunity; however it is larger and SSB is not as good (newer DE1103 units have improved SSB)."

You sure did...

I have a Kenwood TS480sat hf transceiver and the 1103 is the easy
choice to check the bands for activity. Hell, I can get topband nets
just as readable - amazing little radio for the money.

It is handy as a digital mode receiver as well

I use DM780 software standalone to decode psk, rtty (and yes cw)
For those who dont know...
You simply connect audio from 1103 to pc line in and the software
(mostly free) displays all the weird noises as text and even slow scan
tv pictures from around the world - great!

Mike:

I run the audio from my 1103 into my iMac, using Cocoamodem software. The only difficulty has been the high amount of noise that the cabling into my A/D converter seems to bring. I've put an audio rfi eliminator into the line, and it hasn't helped all that much.

I can copy PSK31, Morse, RTTY and similar, but the signal isn't very clean, and I am sure that I am missing a lot of the band action. Any suggestions?

use a 1:1 audio isolating transformer from Radio Shack
red, white, blue, green and black(not used) wires on it

Use red white as input I believe and Blue Green to your
computer software input for fax and rtty. The hashing
sound should diminish quite a bit.

Also an old isolating power transformer would
be good too. for filtering ac similar hash noise

use ac input for audio input out output as dc out.
normally used to be filtered with capacitors for
filtered dc voltage,

Transformers from old modems / modem cards work really well too.

Hi Jens,

If i recall it correctly:
SSB-mode, appr. 1900Hz below station frequency.
E.g.: station frequency 518 kHz
receiver frequency 516.1 kHz
Play a little with the off-set freq. 1900 Hz.

Hope it helps a little...

Hey Jan,
thank you for your suggestion. I already read about this. The German weather service (DWD) uses three frequencies. I tried them all and als tried -2 and -1 kHz. No luck. All I get is diagonal strips. So actually I do receive something (I also hear the signal), is just totally distorted.

This is so strange, as I receive RTTY just fine.
Oh and by the way: I live only about 20km away from the transmitter site. So have you done it successfully with your DE1103?

Best regards
Jens

Hi Jens,

Read the help-files of that program
and search for "slant correction".

The bandwidth switch between "TUNE" wheel and "FINE" wheel:
select narrow / news.(Receiver DE / Kiota? 1103)

Playing with the frequency can also be done using
the "FINE" tuning wheel.

You are half way down because there is a picture
only it is not readiable.
==========
Help file SeaTTY 2.0:

"<-/|\->" button is used for slant correction. Vertical lines of
received image are slanted when sound card sampling frequency
difference from nominal one. Slant correction, at first, fix received
image and, at second, calculate real sampling frequency to avoid slant
distortion in future receiving.
==========

Write down on paper every simple changes you made
because human memory is not reliable....

Regards:

jan

Hi Jens,

I try it now. I use signal direct from Degen line out to computer line in. Software JVCOMM32, IOC 576, LPM120. It work without problem, I use mini-whip antenna. See picture in "files".

But small problem: if you receive 3855kHz, you must set 3854kHz because BFO has very small band and if you set 3855, you cannot set good signal for software!

Some warnings for a newbie on this receiver I consider very important:

1)Read the instruction manual to learn the basic operating procedures. You have to fullfil the "learning curve". It's not so difficult.

2)Do not play extensively with the telescopic detachable antenna. It's reported to be delicate. For FM reception very good to excellent results are achieved with the telescopic antenna collapsed, particularly if you live in an urban or suburban area. You surely will discover new stations never listened before.

3)MW reception of stations from different geographical locations -considering the direction where they are coming from- can be better received (and separated if they are in the same or very near/adjacent frequency) by rotating the receiver in an horizontal plane.

4)It's better you charge the supplied batteries in a separate dedicated battery charger. The best are NiMH batteries. The built in charger in the receiver doesn't rival the performance of a separated one.

5)Better results in SW are with an external antenna, no need to be very long. Try the simple way, a wire (can be insulated) between two anchor points, better if isolated from ground (walls, trees), and the proximal end of the wire connected to a mono plug to the antenna jack. The ground terminal of the plug should be connected to electrical ground, an exclusive one (don't use the house ground).

6)Be careful to avoid touching the telescopic antenna in dry and windy weather, without discharging both yourself and the near end tip the external antenna the eventual static electrical charge the body, cloth, antenna may had gained in those days with the referred atmospheric conditions. Also disconnect (mains/external antenna) and do not work with the radio whenever strong electrical storm occur.

I am forgetting something :)

Good luck!!!

Regards

Horacio

From: legonedijk
Topic: 1774 Message: 1790

Very early good morning Jens and Jara "the rat",

Good contrast on both pictures!!
The picture from Jens is a bit strange...white marks!!!
What you can do is making a .wav / audio recording of that
signal from the 1103 and replay it as an input for the program
that will gives you the picture. Duplex facility of the soundcard
must be there.
Play with input volume of the soundcard.

Beside all: never use a mono jack 3,5 mm as input to your
soundcard !!! Always a stereo jack!!
For the laptop, if there is no line-in / stereo, you can use a mono
jack for the mic-in.

In my case the laptop is a problem maker. Interference
or a ground loop is what it gives.

About the soundcard:
Using programs like WxtoImg, Shipplotter, MMSStv,PDW...etc..etc..
a simple outdated soundcard is the best.

Mister Jara "the rat" correct me if i wrote some stupid things.

B.t.w.: Sorry for my 2penny English...

Reg.: jan

Hi Jan,

I think that problem with stereojack is not in all cases. Here is problem only if you use software, which need signal in both channels, but most software work also with signal only in left, right (or both) channels by setting. You can often set also line or mic input in computer.
It is for instance Hoka Code (Code 300-32), Skysweeper...
(see http://www.krysatec.benghi.org/obrazky/jine-others/hokacode.jpg and http://www.krysatec.benghi.org/obrazky/jine-others/skyssw.png)

But you need not very good computer, you can use "Hamcomm modem" and software for DOS: (JVfax 7 for fax, other programs for SSTV and VERY good software Radioraft for RTTY and other modes! Hamcom modem is simply, you can built it homemade, you need only a few parts and one IC, for instance "old" uA741...)

I often use Radioraft, because it is better than other and complicated programs. (It dont work under WinXp! You must start your computer in DOS!...and you need also comport in your computer, not only "USB", but you need not audiocard and programme work also with 386 or 486 - neeed not "Pentium"!!)

(see: http://www.krysatec.benghi.org/obrazky/jine-others/rraft2.gif)

I think that problem is if you use stereojack and mic-in input.
Here is one wire for audio but second wire for power for electret mic!
And it is problem, because you send some voltage from computer to audio output and it is not good for every receiver!

Your DE1103 you can use also with others programme, see:

http://www.krysatec.benghi.org/obrazky/jine-others/ale.png
http://www.krysatec.benghi.org/obrazky/jine-others/selcal.png
http://www.krysatec.benghi.org/obrazky/jine-others/hfdl.png

but stability of BFO is not very good for HFDL...

You can try also SSTV! (see: http://www.krysatec.benghi.org/obrazky/jine-others/mmsstv.jpg)

And for audio you can use very good software Xcorder, see: http://www.krysatec.benghi.org/obrazky/jine-others/xcorder.jpg

Best regards, Jara "Rat"

Hi,

I have two DE1103 and one DE1121, and somebody say that 1121 use the same receiver as 1102.

Both problem is "shit rechergable battery by Degen". You must use other... or use very problematic system for formatting of battery.

DE1103 is very good, I have two: one with homemade ouput for RDS decoder and 150/180kHz IF filters in 10.7MHz IF in my hamshack and second with 110/110kHz filters for "portable". (You can heard stations which you cannot heard with wide band filters, but 110kHz is very narrow for good function of RDS decoder!)

I think that DE1102 (also as 1121) have not external antenna input for LW/MW band and it is bad... but with DE1103 you can tune from "0" kHz to 40MHz (russian modification by setting) and here you can use external input also for LW/MW band!!!
And you can also use telescopic antenna also for LW/MW -it is often better than feritte antenna!!!

DE1121 have not line out audio, it is also very bad.

I must say that immunity and selectivity of DE1121 (and I think that 1102 is the same) is very very bad for AM and also FM!!!
And BFO has very hard setting...

I dont know sure, if DE1121 is "better version" of DE1102, but it is "big step to shit"! (Control is very complicated, often indeterminate, and parameters are very poor!)
Best idea will be "DE1103 with MP recorder..."

Or: better idea than DE1121 is "buy DE1103 and external MP3 recorder"
...
And best idea is DE1103 with other display and for instance with RDS decoder!

Only one is terrible: DE1103 volume setting! Yes, you can try change "volume" and "bfo" by russian modification, but it is not help which you often heard also SSB.

I tested also ATS909, but it is big as brick, parameters are not better and audio quality by internal speaker is not very good. Many peoples here say that DE1103 have better audio...

De1103 work also often better than biggest and more costly receivers. For instance: I heard without problems HAM beacon SK6RUD in 10MHz band from JO67KI and I live in JN89HE locator. Beacon use GP antenna and 0, 5W EIRP! (I use 10m longwire)
(But...no signal with DE1121.)

Best regards, Jara "Rat"

1794. Preselector 50kHz ...30MHz

Yahoo group: de1103
Date: 2008-08-01 08:17:50 UTC
From: Jara
Topic: 1794 Message: 1794

Hi all,

I sent to "files" many pictures of my home made preselector, which I use with Degens and with my DX394. (But it work also with OTHER receivers!)

Sorry, here is not text, but schematics is very simply and you can see pictures! (Only one: if you can , use metall box, not plastic as me!) If you have problem, you can write me!

All is tested, I built more than 50 preselectors for my friends or CSDXC (Czechoslovak DX Club) members.

You can use it also with "active antenna", good is "mini-whip" by PA0RDT!

PCB is in "1:1" bmp file: you can make own by picture.
Box is plastic box KP4: see here:
http://www.ges.cz/?search=KP4&page=index&inc=search&or=sort&ipp=12&lang=cz&cur=CZK

but metall box is better!!! (But very problematic and costly here for me...)

You can use it for more receivers, and many antennas: I use it for mini-whip, 40m longwire, T2FD, GP 28MHz and CB antenna 1/2lambda for 27MHz band.

If you have small parts, you can built it smaller! (problem is with small capacitor and small switch for bands here...)

See also solar power supply with also 4NiMH accu for Degen:

power supply 12V and cca 1,7 to 12V regulated with Pb accu 12V 1,3Ah in "old box for 10 diskette"....

It is very good for portable: you can use 12V for preamlifier or active antenna and regulated voltage for receiver or scanner currently.

I hope that it will be inspire for you!

And sorry my english, I learnt it cca. 25y ago...

Best regards, Jara "Rat"

Hi Jarat,

If you compare a mono and a stereo jack there is a posibility
that the mono jack short-circuit one of the stereo channels to
ground.

The audio input on a vista laptop is in my case a simple mic-in.
Pc-HFDL 2.041 is not possible on the vista laptop.

One remark: thanks for your input!!!!

From: texnote
Topic: 1797 Message: 1797

I understand that the RF circuitry in the DE1103 is virtually identical to the Eton E5/Grundig G5. However for those with both radios, especially more recent DE1103 units, do you notice any performance differences on AM, FM, or SW? If you already have an E5, does it make sense at all to get a 1103 as well?

It doesn't make sense to replace the E5/G5 with a DE1103 since they have the same RF performance but if you want a 2nd receiver then the DE1103 is half the price so that would be my choice.

I just bought the G5 on sale at Radio Shack after weighing the pros and cons of both. Ultimately I made my decision based on two factors: first, I prefer to be able to buy something locally in case there's a problem with it, and second, I much preferred the G5 look and layout to the Degen interface with the analog pointer. My guess is that aside from the differences on the front panel, they are functionally identical.

I took my G5 apart and confirmed that it has the factory diode protection installed. It would be interesting to know if they are also present in the latest DE1103's.

The only real way to know is to open up the radio and look just below where the whip antenna is connected, and if you see two glass diodes (are probably colored reddish brown) then the diodes are installed.

I think you can probably buy the diodes from kiwa (kiwa.com) and install it yourself. Kiwa sells it for the Eton E5/Grundig G5, but they should work for the DE1103.

I took my 1103 apart today to have a look inside.
I got it all back together fine except for the little lanyard carrying rope thing. I can't get this to stay in the radio. Does it loop around someting inside the radio?
Mine just slips out of the radio and wont stay in.

If I remember correctly (took mine out and left it out on purpose) the
strap has a little nylon loop (thread like) which goes through the strap
hole, down over the screw (case) just below the antenna mounting point.

Ok I got it back in thanks for the info. I was able to get the loop
over the screw hole at the antenna mounting point. It was a real
pain but I got it..

Thanks again

1811. MWLIST worldwide mediumwave & longwave database

Yahoo group: de1103
Date: 2008-08-16 19:50:40 UTC
From: bjorntryba
Topic: 1811 Message: 1811

Dear radio listeners and DXers,

this is a friendly invitaion to MWLIST (Mediumwave List)

welcome to MWLIST, this is a new easy to use free public
worldwide software database of mediumwave & longwave
broadcast stations.

www.mwlist.org

Additionaly, bandscans or logs can instantly be created or
edited using the PHP online MyAM tool included in MWLIST.
This makes creating bandscans much easier and handled
more practicaly, export
in csv spreapsheet format is possible, this can be converted to
excel or other formats. The regular html format can easliy be
copied and added elsewhere. Bandscans can be linked directly
to other websites and logs easily copied into forums or mailing
lists.

Our team wants to follow a new concept and our goal is to
create a much more diverse and much more usable software
and data resource than ever before for broadcast radio.

This database software can be used also as a framework for
exporting or presenting radio station data on other websites, if
you are interested in becoming a partner website of MWLIST,
please see contact details below.

For AM and MW DXers worldwide

Interested in AM radio - MW DXing - LW DXing?

Why not join the MWLIST project!

MWLIST is a (non-commercial, hobby-made) worldwide
database of MW & LW radio stations

We feature world-wide data and seek:

- Data sources for MW radio from all around the world

- Collaborators as country editors and news reporters from all
over the world

- More location or transmitter details, more technical details

- MW DXers to make use of the data for logs, bandscans and further reception analysis

MWLIST includes map, logs and bandscan features, data is available on-line, you can download it as PDF file or convert logs to a spreadsheet format. Direct linking of any bandscan is possible.

Please let us know what you think about this project, or notify us about any missing stations and more corrections.

Please have a look at http://www.mwlist.org/ or get in touch with us at:

glorenz@...

the first major update for MWLIST data from North America (CAN and USA) is now complete, these first steps included converting coordinates to precisce arcsecond readings, updating station names and call signs, removing or updating inactive stations in Canada, a few coordinates on Caribbean islands. Additionaly data for many locations in Asia was updated including precisce coordinates.

This means that if you now go to the MWLIST country list and select to show a transmitter map CAN or the US you can see amost all transmitters at once on Google Earth, try it out!

The next planned major update includes adding low power MW and TIS stations from CAN and the US, plus updating coordinates from Mexico to arcsecond readings. Next we plan to integrate day and night antenna diagram maps for US MW transmitters.

Another big data update is planned for Brasil including very presisce coordinates, already a few stations like 1220 Radio Globo use arcsecond coordinates (visible on a map link).

Any reports or suggestions, comments are most welcome. Reports can easily be done using the interface of the database software, anyone wanting to edit or update data can join our team.

Thanks for your attention and best regards

Björn Tryba and Günter Lorenz (FMLIST and MWLIST database team)

www.mwlist.org - www.fmlist.org

It's too bad that manufacturers don't make decent leather carry cases
for their radios anymore.

I remember this radio

http://www.oldradios.com/tn/dec96/index.htm

came with a real leather case and carry strap included. The leather
would get scuffed a little but the radio remained pristine -- and the
radio didn't have to be removed until the batteries needed changing.

All you can find now is some cheap plastic pouch that is only useful
to store the radio in.

1817. Cable in mic instead of line in

Yahoo group: de1103
Date: 2008-08-20 04:10:09 UTC
From: Sean Bradford Inggs
Topic: 1817 Message: 1817

Hi all,

I came across a post here mentioning using carefully aimmed nailpolish on the plug into the mic helps cut down the noise but is there still voltage going to the radio then? Will this damage the radio?

I look forward to your comments.

I apologise if it's already been mentioned and a solution has been made, I searched but didn't find anything (it is 6am and I havent slept yet so it's possible I did...)

Many thanks
Brad

1818. SV: [de1103] Re: Diode protection?

Yahoo group: de1103

From: Nelson
Topic: 1804 Message: 1818

Roland,

I just purchased a G5, but the board is the same. If you take your unit apart, there should be two glass diodes in parallel facing in opposite directions soldered from the antenna terminal to circuit board ground. It's fairly noticeable, since it's clearly an afterthought.

Looking at the schematic, it seems that the external antenna bypasses Q1, so it probably isn't an issue.

Nelson

I tested with my milivolt meter and it said no, there is no voltage using a 24v 10 amp transformer on one end of the cable and the meter on the other end with a range of jacks.

I have also tried several types of nail polish.

The best working polish for this task is the cheap clear extra hardness from the local supermarket or discounter. "Sally Hansen" and "Walmart" are the current bottle but others have been tested previously.

Another good choice is the 'sally beauty' undercoat, though this one dries with a bit of a tackiness like really old soda spilled on a table a month ago. Not enough stick to cause trouble but enough to make me wonder if long term it may.

There is also a pitch black a friend got which she thinks she found at trenz or similar in the malls. no idea what is in that stuff but it lasts forever on a audio cable and makes it very easy to spot the protected cables versus the unprotected ones.

I have been told also that the polish designed to be used on cheap nail extensions works very well but have not tested personally.

Many brightly colored polishes however do *not* pass the meter test above, assumption is that they contain metal in the pigment.

Many polishes with sparkles failed the test as well.

The exception to this is the laser cut hologram sparkly stuff you see in sally beauty and the mall shops. (given the amount of work my niece goes through to remove the stuff when she is tired of sparkly not

surprising).

I am very confused the DE1103 does not have any mic input. (only has
a line output socket) Nevertheless what all "nailpolish"resolution
you are all talking about?

From: chuckmf1135
Topic: 1821 Message: 1821

Hello, I just signed up yesterday, I picked up a Kato de 1103 @ the Shelby amateur radio hamfest & have a few questions, I checked the specs on 1103 & it said they went to 29,999mhz.
This one came w/all the papers & said it was purchased new in May 2005 and the booklet list coverage to 26,100mhz but the radio only shows 21.9 mhz on the top end of the last band (marked 13m).
Second I was hoping to pickup the 10.1 - 10.125 mhz/30 meter band but the radios band ends @ 9.9mhz & skips to 12.4Mhz for the next one.
I guess this is a earlier version that has limited range? The owner wasent their at the time & for $45 like new in box I wasent going to wait, there were others looking at the Kaito 1103 too.

Try entering the frequencies via the keypad (enter freqquency in kHz and
press the BAND+ key). You will then be then ba able to tune up and down
around the frequency. You can put them in the memory for rapid access.

1826. Re: 1st time user questions

Yahoo group: de1103
Date: 2008-09-01 19:49:58 UTC
From: Greg Shoom
Topic: 1821 Message: 1826

The Kaito/DE 1103 tuning is a bit weird. It actually does tune the frequencies you want, but they're not shown on the bands on the front panel.

The 1103 divides the tuning range into a number of bands. These correspond to the broadcast bands, but are wider. When you're inside one of these bands, moving up or down using the tuning knob moves you through the band you're in, but not past its limits. However, the bands ranges they've chosed do not cover the entire shortwave spectrum. There are sections of shortwave that are not in any of their bands. But the radio can actually receive these. You just have to type in the frequency directly. And once you're on a frequency that isn't in any band, the up and down tuning knob works the way you'd expect it to, at least until you tune into one of their predefined bands again.

It's a bit counterintuitive but you get used to it after a while.

The 1103 also has longwave coverage, down to 100 kHz, which is something you wouldn't guess from looking at the front panel. And it's actually a pretty sensitive longwave receiver.

hahaha this makes me laugh, guys talking about nail polish...

Thanks though for the types of nail polish mate, I'll ummm... be sure to send my lady to get some for me *cough* I mean my radio...

For those completely lost, yes guys, we talking about making sure voltage doesnt go back into the radio's earphone socket from the mic input on your laptop because it can damage the radio. I saw some weeks/months back someone mentioning nail polish worked if you put some over the black areas.

Another idea though, I saw the inside of one of my earphone cables and it has three connections inside, if I disconnection a cable from the area that is meant for voltage, wouldn't that be another way?

If any has alternative ideas, always welcome too.

Thanks all! Gracias :)

When using the radio on a pc connected to the mic input of the pc there is a voltage present on the ring of the stereo connector.

This voltage causes grief with many items not just the de1103.

The instructions I have previously posted allow you to use the more sensitive mic input of your pc without the weirdness or possible damage from that voltage.

The voltage is intended to power special microphones (most pc microphones) which often have some noise reduction and amplification circuitry included.

Yes you can also cut the wire to the ring of the plug on either end.

```
part line mic
==== ==== ====
tip signal L mic audio
ring signal R mic voltage
shield ground
molded bits hold here
wire delivers signal to the other end of the wire

() tip
[] black bit
() ring {{disconnect here how ever you choose}}
[] black bit
||
|| shield
||
------
| |
| | molded bits
| |
| |
~~
~~ wire
~~
```

Just make sure you carefully identify which wire to cut otherwise the cable becomes useful only for passing power to a mic it cant hear anymore or half of a stereo audio signal.

It is not the black areas that get covered, it is the little ring of metal between the two black spots on a stereo cable.

If you have a mono cable you MAY hurt your sound card, though probably not the radio as it moves the voltage problem from the radio not knowing how to deal with +5v on what it wants to think is Right-audio to the sound card not knowing how to deal with +5v on the ground/shield.

http://www.hobby-hour.com/electronics/computer_microphone.php has some more info, including circuits for using this feature to oddly enough power a mic.

I purchase nail polish for several uses, it is much less expensive and often more useful for locking nuts, blots, screws, etc. than locktite. Bonus the un-locker is also less expensive and often more useful.

It is useful for coating many things to protect them (example, I used to purchase screen protectors for my palm-pilot until a girl geek showed me how she took care of hers with thinned clear polish over the writing area only... lasts longer and does a better job, doesnt get bunched up and it still works when it is close to time for the next application).

Making some things shiny by first coating them then using a leather buffer to get a polish.

keeping water out of many things.

marking some things as they come apart so they go back together correctly.

Keeping the wife happy! (the things we do for "she who must be obeyed" with apologies to Rumpole).

etc :)

For the record a guy buying nail polish... more often than not makes any straight and/or available female happening to be at the checkout who thinks the guy is straight and or available all squishy-kneed as they wish they could talk their guys into doing that...

Bonus if you happen to be single-ish "ohhh sweet that you would do that for your girl!" or she likes weird guys "ohhhh, you paint your nails!".

I can however not vouch for the color differences in the checkout line.

(o-O)

Thanks for all the information, ther is allways improtant things they never include in the manual. It would be nice to have a file labled tips and hints for things not covered in the manual. Anyway I can now navigate through the litte super radio with easy thanks to everyone.

OK, it is clear now. Then a capacitor of appropriate value (just by
trial and error) could be added in series with the "live" wire to
block the DC component.

FWIW I have two 1103s and have been happy with them both to the
exclusion of all other HF rigs I own or have owned. The only other rig
I use on the HF freqs is my Icom R2 and then only because the searching
functions are much better on the R2 (define bands, programmed skip,
etc.) The radios all pick up the same signals equally well as long as
it matches the R2s 5khz spacing.

Caveat is that the 1103s are also very good at picking up the neighbors
noisemaker (unidentified neighbor or noisemaker) which randomly block
large chunks of spectrum :(

I've compared mine with an ex-Royal Navy Redifon R551N communications receiver, and the sensitivity of the DE1103 on the whip antenna was about the same as the R551N with a long wire and ATU. Given that the R551N cost over 100x as much as the DE1103, originally, the DE1103 is pretty good.

1839. Re: Is This Ad Honest?

Yahoo group: de1103
Date: 2008-09-05 06:57:06 UTC
From: Dennis Gibson
Topic: 1832 Message: 1839

I bought a Sony ICF-SW7600GR about a year and a half ago. It has been a major disappointment. The synchronous detection is OK but not as good as in my Sony ICF-2010 and the audio quality leaves a lot to be desired. My 7600GR (and many others) has a problem with the fine tuning for SSB. There is an instability problem that makes it hard to tune in SSB signals properly. I started seeing many great reviews for the Degen DE1103/ Kaito KA1103 so I decided to try one. It's so good that I rarely use the Sony 7600GR any more. The KA1103 cost me half of what the Sony did and the SSB is excellent. The Sony isn't a bad radio and synchronous detection is a great feature at that price.

The 1103 has some weird ergonomics but it didn't take me very long to get used to them.

Here are what other owners have to say about the DE1103/KA1103:

http://www.eham.net/reviews/detail/4288

http://www.eham.net/reviews/detail/5071

Both the Radio Shack DX-440 and Yacht Boy 400 have great reputations but I've never used either one.

I'd say go for the KA1103. $79.99 is a pretty good price.

Let us know how you like it.

From: Greg Shoom
Topic: 1832 Message: 1841

I don't know how the Kaito 1103 stacks up against those other radios you listed. What I do know is that my Kaito 1103 performs so well that it has become the radio I take with me whenever I travel somewhere and want to do some DXing.

This summer, when I was travelling in the Bruce Peninsula and Manitoulin Island areas of Ontario, Canada, I used it to log lots and lots of very faint longwave beacons. I used it to listen to mediumwave stations from distant cities in the evening when I was camping. And I also had my first ever meteor-scatter reception on FM with it.

Last summer I took it to Newfoundland, where I used it to catch numerous trans-atlantic mediumwave stations, using nothing more than the antenna built in the radio. A couple of them, like Virgin Radio on 1215 kHz from London, were coming in strongly enough that I could follow the programming. I also used it on that trip to log two European longwave broadcasters, the first time in my life that I've ever heard any of those.

So regardless of how it actually compares to those other radios, it is a great radio to own, and at the price it's a real bargain.

The only one of those other radios you listed that I've owned and used is the Grundig YB-400. That used to be my main travel radio, and I think it is also a fine receiver. Unfortunately, the plastic connector that held the telescopic antenna in place has broken, so now my YB-400 is to fragile to travel with, although it still works fine.

I had the same problem. I ordered mine through Amazon (US), which said it was sold directly from Kaito Electronics. I returned it complaining it looked used/refurbished and after a long delay got my money back.

The replacement I got from eBay came directly from China (Degen-branded) and looks perfect.

Bought mine from an eBay seller, tquchina, for $49.90 plus shipping. As I would have had to import one from either the USA or HK, I opted for the Degen de 1103 from HK as it was half the price of the Kaito and included a 220v power pack, which is suitable for our local voltage. It appears many people have had hassles with the Kaito 110v power pack, but the 220v ones seem to be fine. I did install better batteries, however.

The well-packaged radio took just over a week to arrive.

Thanks guys, this all helps a lot!

That "diagram" of the cable jack was perfect, been hunting for an explanation like that but couldn't find it on google.
Also interesting with the capacitor.

Great stuff guys, thanks!

PS I just got my DE1103 now from China and I'm amazed how small it is, loving this little thing. Built quite sturdy too... China...well done.

PSS also enjoyed the nail polish and checkout girl encounter, sounds like a plan ;)

#1 is degen picked up by a friend in china (with english everything
except manual) and was perfect until I opened it LOL.

#2 is also degen and ebay from china, also perfect (and still is)

I have heard several others complain of the same thing. I wonder if
there a manufacturing or distribution process problem.

I say this because the one picked up in china had no plastic protectors
on the screen while the ebay one did.

The one picked up in china was perfectly sealed while the ebay radio was
kind of dumped in the bag and stuffed in the box. It was sealed and
taped just looked a little rushed maybe.

There was no plastic covering on the display of my new KA1103. Does that mean it's a return or refurb? I sure don't like the scuff marks on the display!

It sounds like it. Have you contacted Kaito?

You could polish the marks out, of course. Toothpaste works very well.

The seller was tquchina. 100 % good feedback rating. On ebay since about 2003. Sent me two correspondences and thanked me for the order. He offered me insurance for about $6 US. I researched the insurance company and was not impressed. Took about 18 days from china to my little town in the mountains near san diego, california. I did get a little nerv ous about the delivery time. If it does fail I have the schematic and 32 years of teaching electronics and I guess I could send it back for less than original $24 because it would not have a very high value not working.

Sounds pretty shortsited business wise. The radio cost them less than $40 probably. They could recoup that even selling it refurbished. My seller insured mine for only $23 when he shipped it so i am guessing that is in the ball park of what it cost them. I am pretty sure it is illegal to sell a refurbished as new without notifying customer. I got a tape back up unit once from a major dealer that had been re shrinkwrapped and sold as new. Inside the user manual I found a hand written note from a former buyer concerning contacting customer service which would indicate that it was at least a returned unit. I know I will avoid that retailer (radios4u) in the future.

Yahoo group: de1103
Date: 2008-09-09 21:05:37 UTC
From: 3CX100A5
Topic: 1797 Message: 1863

Hi Folks,

My two DE1103's are about 1 year old now. They have far superior FM sensitivity and selectivity than my 6 month old Eton E5!

However the E5 has better SW sensitivity than the DE1103's.

Both DE1103's have very similar performance. I use them for FM reception and the E5 for SW. The SW difference is much less than the FM difference, so overall the DE1103's are best from a performance point of view. The user interface of the E5 is far superior to the DE1103, if that is important to you and FM of little or no interest.

Best wishes, John.

Bill, I bought the Grundig G5 version, but returned the first because I was unsatisfied with the number of AM broadcast images on LW. The second one is slightly newer and actually seems better in that regard. All of these radios are manufactured by Degen, AFAIK.

In any case, the first unit clearly had protective film on the display, because it was slightly curled in one corner. When I got the replacement unit yesterday I though I also had some light scuffing on the display, until I realized that the protective film is actually present, but it's so perfectly applied you can't tell without magnification. The film is soft and scuffs easily, and you can dent it with your fingernail, which you can't do with the acrylic window. It really fooled me. Your display window is much larger, but maybe the protective film is actually still there.

I could peel it off if I wanted to, but I think I'll leave it there for the protection, since it's hardly noticeable.

Yes. Degen makes the Degen DE-1103 which is rabadged (by Degen for Kaito) as the Kaito KA-1103. Degen also manufactures the Eton E5 and identical Grundig G5 for Eton/Grundig...Eton merely imports and sells them.

The Chinese manufactures (Degen, Tecsun and Redsun) all do this. In addition to making the rebadged versions they may make small changes for the importer. For exmaple, The Redsun RP-2100 is the same as the C.C. Radio SW (Crane's claims that their version is somehow improved notwithstanding) , but Redsun makes a few changes for C. Crane, primarily the AC Power supply. Same with Kaito...the KA-1103 is sold only in the US with a 120 volt AC wall wart, while the Degen DE-1103 usually comes with a 220 volt vallw art (although to ocnfuse things some Chinese OEM models are also avaialble with 120 or 240volts).

John,

I think you are seeing unit to unit differences here...my E5 is at least as good as my DE-1103's on all bands...and they should be really be identical except for any periodic updates as the RF/IF circuits are the same...only the user interface is different.

1868. DAB+ in Australia

Yahoo group: de1103
Date: 2008-09-10 10:55:24 UTC
From: ian.campbell99
Topic: 1868 Message: 1868

A bit off topic but there has been an announcement on the rollout of
digital radio in Australia.
http://www.digitalradioaustralia.com.au/index.cfm?page_id=1001&display_news_id_1129=1015
They are using DAB+.
I can't see it being successful unless it is considerably better than
analogue and has receivers at a competitive price to analogue receivers.

I've got a (UK) DAB radio - BT Aviator for about ?120 four or so years ago. I like it in some respects, but the audio quality isn't very good as there are too many stations on the one frequency and the bandwidth has to be restricted. DAB+ is probably better. The radio software has some bugs - it loses the signal and I have to switch it on and off several times to get it working again. I got a replacement and that was the same (plus a faulty PS and sticking switch), so I kept them both. The supplier didn't chase me up about returning the original one. I bought that model primarily because it uses an ADI Blackfin DSP, which is a chip that I've used.

A cheap DAB radio isn't much more expensive than an analogue one, now.

My new 1103 is a Degen. It came from ebay (china tquchina). Has english control lables. It came with a 120 volt plug-in. Very good receiver for the money.

Three suggestions to whoever builds it.

1. The frequency display lcd reminds me of an old radio with a tuning dial cord that slips.
Save the money on this useless "feature" and give me a separate volume control.

2. I really dislike having my ears bloiwn up when I shift bands and can't switch to volume mode fast enough. If I have it on speaker my wife jumps everytime the volume blast out when I change bands.

3. Do not turn off the ssb clarifier when activating the up down band switch changes.The radio is so small that I am constantly juggling it from hand to hand to change bands, change the volume, and reset the ssb clarifier, and punch the tiny, too close together numerical buttons.

HI,

I´m owner of both receivers and have some experience with a lot of radios.
Here is my experience with Tecsun PL-600:
1. PL-600 works good on AM.
2. Relatively good sensitivity and selectivity on SW, MW, LW, similar
to the standard DE1103 but still seems for me the reception little
noise and not to much stable in comparison with DE1103 (especially by
SSB).
3. FM reception is very poor - deficit of selectivity due to lack of
narrower filters.
(Inside is only one FM filter !)
4.Good sound, friendly to operate.
5.My subjective comparison PL-600 to Degen DE1103:
PL-600 : 6 points
DE1103 : 10 points

Awaiting your experience independently of
promotion reviews.

Have a nice day!
Mr. O.K.

To get the same radio without the LCD display and with a separate volume control you'd have to spend twice as much and get an Eton E5/Grundig G5.

I keep reading about the volume jumping when changing bands. My KA1103 has never done that.

The fastest control over volume control is the key combination via numbers and volume keys, i.e.: I am listening at volume 23, and I want to change to volume 11, I press: 1+1+vol.

The numerical readout is fine but they could use a simpler lcd numerical readout and ditch the phony analog line indicator.
I don't think that adding one potentiometer would cost very much more than adding the two antenna protection diodes. I don't see how it could double the price.
A simple fact of life, the background noise levels varies greatly from low end to high end of the receivable spectrum .

Last time I had my receiver open (a qualified technician who works on car electronics service), he used the compressed air blower he has in his shack. I had some faulty tuning, and this dissapeared. It would be not harmful to try to get some improvement by cleaning the encoder area following this procedure.

Before I diagnosed and replaced my encoder on my older DE1103, I noticed that it would skip consistantly when the jog dial was at a certain position. Upon further inspection, I noticed that one of the "fan blades" (see Jog Dial Internals) was damaged and the wiper would skip when it passed over the damaged area. The wiper would loose contact and the frequency (or volume) would reverse direction by one increment.

If you notice that your jog dial skips spuratically (not in the same place), then there may be loose material that can be cleaned (or blown) out. If you open it up and wipe off the grease, be sure to replace it with grease (or ProGold) to prevent further oxidation.

Regards,
Thad

I have a considerably different opinion. I too own way too many radios...well over 100. I find the Degen DE1103/Kaito KA-1103/Eton E5/Grundig G5 to be amazing portables with top tier RF performance in this size class...nothing matches them. I had two PL600's and didn't feel they were even close.

The PL600 has much noisier reception on AM and SW with hets and spurious tones on much of the AM band and FM that was far less selectivive.

I did not keep my PL-600's...and I relaly wanted to like this radio as I thought it would be an upgrade to the PL-550.

I've never used an E5/G5 but the circuitry and performance are supposedly virtually identical. I've read of jog dial problems but they mostly seem to be with the DE1103 and not the KA1103. I've had my KA1103 a little over a year and it hasn't hiccuped once. A KA1103 goes for about $80.00 and an E5/G5 goes for $150.00. I'll gladly put up with the 1103's weird ergonomics.

Jay - I didn't know it was possible to own too many radios! I have about 20 and I thought that was a lot. Every time I tell myself I've bought my last radio something interesting comes along. A little earlier this year I gave away a Realistic 12-655 TRF (I had two); all of the great things you've heard about it are true. I also have their other TRF (the 12-656A); it is as sensitive but not as selective. I park them on graveyard frequencies.

My newest acquisitions are a Sangean DT-400W (AM/FM only; it just came out) and an Eton E100. I recommend the Sangean for its excellent sensitivity across the entire AM band but to get it to sell for $55.00 they skimped a bit on the selectivity. It has a speaker and weather alert. The E100 is a dinky E10 (it literally fits in your hand) but it doesn't have an external antenna input. Stock E100's are hearing Trans Pacific DX from the Pacific Northwest.

The Kaito KA1103 is an outrageous value. Its the perfect radio for someone just getting started in AM DX'ing or SW. I only have one gripe; the grill is a little delicate. I'm really careful with my radios but somehow it has two dents. I decided it was worth some extra $$ to get the US version with the 120 volt AC adapter and US warranty. If you're not in China and your DE1103 breaks you may as well toss it because the cost of shipping it to China and back will equal what you paid for it.

1886. Wall-wart cord for 1103 - suddenly flaky?

Yahoo group: de1103
Date: 2008-09-17 18:05:34 UTC
From: wgmartin999
Topic: 1886 Message: 1886

Hi, all!

Been happy with my Kaito KA1103 for some time now. Have been using it plugged into the provided 120-volt wall-wart most of the time, and I suddenly noticed some sort of intermittent power interruption the last couple days. It's hard to tell that the external power is out on this, since the radio automatically uses battery power even if the external-power plug is in the radio's jack but is not actually providing power. The only way you can tell is to have the dial light on and see if it goes out after some seconds of no-control-activation. If it stays on, the radio is getting external power -- if it goes out, the radio is running on batteries.

I think I narrowed it down to an intermittent wire break inside the cable in the very end of the cable from the wall-wart at the point where it moves into the strain relief's L-shaped connection into the power plug at the radio end. But it is very hard to tell, because there's no immediate feedback on whether power is getting through or not. I have to use some other device that works on the same plug size, polarity, and voltage while I wiggle the wire to track down the precise point of failure, or rig up some connections to a meter to watch the voltage and see if it fluctuates.

I was wondering if others with the Kaito and its US-voltage power adapter (this one is sort of a rounded rectangular block) have run into a similar failure. The cable, strain relief, and plug all look perfectly fine -- nothing shows signs of being stretched. I'd think that the strain relief itself was supposed to prevent this sort of thing from happening, so this is irritating.

I suppose that a failure at this point in the cable is actually the easiest thing to fix; just chop off the plug and solder the wires to a new plug of the correct size. But such fixes never look as good as the original-equipment configuration and I'm wondering if the quality of the OEM wall-wart is high enough to justify the effort of the fix -- maybe there's an RF-quieter replacement power supply that it would be worth buying instead?

So, anybody else run into the same thing?

73, Will

I have also not seen trouble with the 1 of 2 I use the included wall
wort with, the other is using a monster battery I built to power the
radio, a scanner, and an antique laptop myself so it doesnt count.

Both wall worts are similar in appearance so I assume the one kept in case of failure is as good as the one used regularly.

From: 3CX100A5
Topic: 1797 Message: 1890

Hi Jay,

I'm quite sure that the FM Band filters in my E5 are much wider than those in my 1103's. It is the filter bandwidth difference which is making the 1103's more sensitive on FM. It also means I can tune much closer to strong stations on the 1103's, without getting interference, than I can with the E5.
All this is related to receiving signals which are only just audible. I did a check on a day when a Belgian station on 98.6MHz was just audible (fading in and out on the 1103's). With the E5 stood in the same spot the signal was just not there.
Tuning towards strong local stations, I can get 100kHz closer with the 1103's, before I hear anything, than I can with the E5.

I wonder if a wider/cheaper FM filter is being used now as the radio is essentially a World Band (ie Short Wave) radio, with FM thrown in for good measure (perhaps it was just accidental that FM performance was also good).

Whatever the reasons both my DE1103's (bought at about the same time but from two different suppliers) are much better weak signal Band II FM receivers than my E5.

With best wishes, John.

From: huelbeag
Topic: 1891 Message: 1891

Hi,

Lyipn / V-COM-COLLECTIONS was one of the first sellers offering Degen DE1103 at eBay. Probably he sold thousands of this receiver and similars.

Today I received a message from him reporting the italian customs is blocking receivers without CE label. As a side-effect he received quite a lot of negative feedback from italian buyers even after refund. Because of this I think eBay "frozen" his store.

He's now operating a new store at this URL:
http://shop.ebay.com/merchant/li_ypn

Obviously, Liypn does not ship to Italy anymore.

The other "big" DE1103 seller, "Radio and Component" (tquchina) is
still operating on ebay. However there is a list of European and
Asiatic countries where they do not ship because of Customs issues.

I'll take your word for it that the 1103 is more selective on FM than the E5, but my E5 can pull out weak FM stations reliably that no other radio can, even in the crowded NYC market with strong competing stations nearby. I hardly listen to FM anyway, since I'm mainly interested in SW DX, so that wouldn't have been a deciding factor for me. The looks, ergonomics, and ability to purchase it locally with a warranty were what tipped the scale in it's favor. I really like being able to scroll through the whole frequency range with the tuning knob as well.

But the strange thing is I found just the opposite when I reviewed the E5 for radiointel and compared it with two DE1103's...the E5 was clearly separating many stations on FM the DE1103's were not. I suspect the DE1103's may have been upgraded since then and in any case they should perform the same as the E5/G5...I wonder if unit to unit differences are creeping in here.

Eric,

In a portable radio, I think the FM section of either the DE1103 or
Eton E5 is hard to beat.

In a tuner, look at the Sony XDR-F1HD. Review is at
http://www.ham-radio.com/k6sti/xdr-f1hd.htm

Hi Paul,

It's a long story...

I bought the Sony IC-7600GR to take along on holiday trips, then I decided it's too good a radio to take to the seaside and possibly rust. (EVERYTHING rusts in Durban!!)

So I bought the Degen DE 1103 to take in its place.

But that is also too good a radio!

Hence my thinking to buy a "cheapie" for that reason, but I also would like it to pick up a couple of low-powered FM stations (~5kW) that transmit from about 100Kms away from where I live, using its own telescopic antenna. Both the Sony & Degen are able to do this quite nicely! :)

Not sure that the Sony XDR-F1HD is available locally, I will make a few enquiries.

Thanks for your response!

Ok, fair enough. I understand. For a cheap radio, if you don't mind a bigger unit than the DE1103, look into the Tecsun R308 (ebay item 190253660261). I don't have one, but I've heard good things about it's sensitivity on FM. See photos at http://www.tecsun.com.cn/product/308/308-2.htm

I am also looking for a good FM radio besides the DE1103 and have been thinking of this model, and the R9700DX. My problem is that apparently the latest 9700DX units all come in Chinese labeling.

1904. SSB Fine Tune knob

Yahoo group: de1103
Date: 2008-09-27 05:41:14 UTC
From: Carlos Vargas Vidal
Topic: 1904 Message: 1904

Hello, everybody. I hope you all are doing well.

I received my Degen 1103 in february. I have not had any problem with this little and amazing radio, so far. It always shows me that it is working good in any way. Of course, this has nothing to do with atmospheric conditions.

The only problem I had was with the SSB fine tuning knob. Since I like to hear utilities I opted for doing something very simple. I listened to several am broadcasting stations (medium power, about 100 kw) using the SSB fine tuning knob until I made sure I could hear them well. Then, using a "touch & go" pencil I marked in white the point in which I was abled to listen well. Of course, it is not and it will never be the exact point, but it is very close to it. Strong station can not be heard well using the SSS fine tuning knob.

I keep my radio with the SSB fine tuning showing the white mark in the middle. And, usually, when hearing those single side banded utilities the white mark is in the middle. I use have to worry about moving the knob a little bit. Never like it happened before. If the station is not close to the right frequency, of course, one has to move the knob farther. So, it is better to be sure that the radio is positioned in the correct frequency. As you know, many transmitters are always off the correct frequency by few hertz. So there is nothing we can do and this little and good radio, too.

I hope you be able to understand my finding and methodology. It is certainly helping me a great deal.

Very best wishes and regards,

Carlos

Hi Carlos,
that is exactly what I did and it is very useful
indeed. It also helps when one wants to make a
rough estimate of the offset of those AM stations
that are not exactly on-frequency, without having
to go back and forth to a known station of reliable frequency.

Yes, Moises, it is also useful for what you mention. But I believe the greatest thing it to keep the tuning section of the radio centered. I can not explain this well in English but I hope you understand. It is so good to hear from you again. I hope everyting is Ok in Uruguay.

Regards,

Carlos

1907. Re: SSB Fine Tune knob

Yahoo group: de1103
Date: 2008-10-01 03:30:17 UTC
From: Tom Holden VE3MEO
Topic: 1904 Message: 1907

If you use the narrow filter and your tuning method, the audio will be muffled and interference in the region of the suppressed sideband will be more objectionable than if you use a tuning method that favours one sideband over the other. I described the technique in message #610. Even for double sideband with carrier, the off-centred tuning of the BFO (Fine Tuning) helps a bit with fading distortions. A shortcoming (at least in my older 1103) is the limited range of the BFO to about +/-1.5 kHz from the IF centre. That prevents shifting the tuning far enough for optimal suppression of the unwanted sideband with the cheap IF filter. However, widening the range to the needed +/-3.5 kHz would make the control far coarser; it's already too coarse.

From: Clyde Benson
Topic: 1909 Message: 1911

My Degen 1103 will not function using the 2500 double AA Energizers.

It works fine using the 2,000 rechargeable batteries.

Is that normal for the radio?

Do you mean it doesn't even turn on? I don't think that anyone else has
mentioned a problem with ordinary batteries.

It sounds as though the batteries were not fully charged or perhaps one was inserted incorrectly or one of them was faulty. The current rating of the cells will not have any bearing. If anything, they should last longer with the higher rated cell.

OK,

With the higher rated 2500 Energizers it would turn on for a secondf,
blink and then shut down. with the 2000 rated Thomas ansmann
batteries, it works finel. I do have a couple of near dead batteries though.

I'll have to make sure that is not the problem.

I'll play with it some more domani mattina.

If the batteries are dead that is what the radio will do. It keeps the batteries from being drained down to nothing and damaging them.

From: Jara
Topic: 1916 Message: 1916

Hi all,

I tested capacity of original "Degen" accumulators from my DE1103 and 1121.

(Photo of my home made tester is here: http://krysatec.benghi.org/phprs/view.php?cisloclanku=2008100701)

And results are terrible!

Here are 1300mAh accumulators, but if you charge it in Degen, capacity is only 200-250mAh!!!

If you use "very good" charger, maximal capacity is cca 800mAh!

I know, that it is not "new information" ... but it was good test for my tester!

Best regards, Jara "Rat", Czechia, EU

I do not think so. I use 2000 and 2400 AA rechargeable batteries regularly, and never had had a difficulty. However, every time I remove batteries, I have to perform a reset on the 1103 or it behaves badly, if at all.

Not "identical" test, because my tester is only 3 days "old"...

But capability of accumulators from my Degens (I have 2x DE1103 and 1x DE1121, 6month to 2years old) are "the same" for all accumulators!
NOT MORE than 800mAh!

(If you use continual discharge 150mA to 1V per one accumulator.
Tester tested two accumulators in serial engagement).

But I tested also other accumulators, for instance Sanyo 1700, see:
http://www.ges.cz/?
ipp=12&lang=en&cur=EUR&or=sort&page=index&of=1&gcat=XL55&inc=browse

and picture: UM 3-NH1700 HR-3U

I have two Sanyo in my camera 2 years. I tested 1A/10 seconds and 10seconds pause. Capability was cca. 1500mAh!!!
I think that result with continual discharge 150mA will be better!

(Sorry, I speak english a little, I learnt it cca 25y ago..)

But here is also other problem! Original "Degen" accumulators you cannot often charge in Degen1103, maximal capability was cca 300mAh after 20hours of charging in Degen!
The same result I have with "BEN Electronic charger" see picture:
http://krysatec.benghi.org/phprs/images/200810081352_111.jpg
(left)
..and this charger is not very "low cost" here!

Better results (800mAh) I have with "low cost" charger Sanyo (the same picture, right) !!!

Best regards, Jara Rat

Dear Gordon:

I have three set of batteries: 1) the Degen 1300 mAh; 2) the Techman 1800 mAh (I believe made also in China); and, 3) the Radio Shack 2100 mAh. They all get charged with a Radio Shack 4-6 hours battery charger and work fine. I mean they all last several hours in the radio. I have not checked the time of each set.

I bought the radio from eBay in february. And I have never performed a reset in the radio.

I would not say more. Best regards,

Carlos

From: Dennis Gibson
Topic: 1921 Message: 1921

Universal Radio has a demo Kaito KA1103 for $56.95, a great price. I bought a demo Kaito KA1101 from them a year and a half ago; there wasn't a scratch on it and all of the accessories were included. If I hadn't bought a couple of new radios recently (Eton E100 and Sangean DT-400W) I'd buy it as a spare.

http://www.universal-radio.com/alert.html

1922. FS: Kaito 1103

Yahoo group: de1103
Date: 2008-10-11 23:42:20 UTC
From: nz8j
Topic: 1922 Message: 1922

I recently bought a second hand Kaito 1103 (Silver color) to use for some ham band listening while camping etc and to complement my Elecraft K1. Unfortunately, it appears to have the blown FET syndrome. It is very sensitive on AM BCB and FM bands, and with an external long wire antenna clipped to the whip it is very sensitive on the ham and shortwave bands, however with just the whip antenna it is deaf as a post on ham and sw bands.(the DX/Local switch is in the dx position) I know there is file that outlines how to replace the FET, but I have neither the time nor patience to do it. The radio is in excellent condition, comes with the original box, manual, power adapter, rechargable batteries, wire plug in antenna, and ear buds.

If some one would like to buy it and fix it, make me an offer, cash or trade for something radio related, ham or shortwave. I'm open to offers.
Thanks
Tim

From: Nash
Topic: 1909 Message: 1923

I have been using the Degen 1300 mAh and Powerex 2300 mAh batteries without any problems. Although the Degen batteries never ran as long as the Powerex, lately they have been dying much sooner. I checked with a battery tester after the last use and found one the four to be completly dead, while the others were just at the point of needing a charge. I also noted afterward that the one problem battery took way longer to recharge.

I would suggest if you are having battery problems just after charging, use a battery tester to check each battery individually. Your charger may only be charging in groups of two or four, so the one bad battery will be mistaken as fully charged.

I am using a Powerex C401FS charger that monitors each battery individually. There are other chargers on the market now that can do the same. I got very poor service from the freeby Degen batteries in the beginning, but when I started charging them in the Powerex charger, they performed much better. Now that the one battery is failing, I would guess that it's time to retire them. I've read it's not good to mix up old & new or different capacity batteries in digital cameras. The same would probably apply to radios too.

Another thing to check is the length of your batteries. There was a post in the distant past by a user who noted the freeby batteries received were marginally shorter than other brands he owned. Also make sure the springs in the battery compartment are seated properly against the battery terminals.

Yahoo group: de1103
Date: 2008-10-12 19:24:47 UTC
From: Carlos Vargas Vidal
Topic: 1909 Message: 1924

Nash: I hope you understando my English. Thanks. I had the same problem with one of my batteries Techman. Then, I did what I read from a battery expert. I took a 12 dc volts adapter a charge the wrong battery (the one completely dead) for about a second, and the battery came back to the point of needing a charge. Since then I have not had any problem with that battery.

Your suggestion about testing every battery before installing is the best to do. It happens that the radio does not function long enough because one or more batteries are not fully charged.

Best regards,

Carlos

1926. Whip modificattion

Yahoo group: de1103
Date: 2008-10-13 14:45:24 UTC
From: Martin
Topic: 1926 Message: 1926

Hi. I am new to the group, and awaiting the delovery of my KA-1103. I would like to share a couple of things. First, a slight modification that I have done to the whip on my Grundig G5. I put heat shrink tubing on the bottom section of the whip. This is to prevent static damage from touching the whip. I know you can still touch the tip, but this lessens the chance of accidental contact. I got the idea from some older protables that I had a few years bac, that had the bottom section of their whips covered with plastic tubing. I will be doing this mod to my KA1193 also.

Another tip for those who might have scuffs or scratches on the clear plastic cover over the LCD display. While toothpaste will work as a polish, I have found that Novus Plastic Polish works better. There are several grades. #1 is mainly for cleaning, and gives a very clean and anti-static surface. #2 is for polishing out small scratches. #3 is for polishing out heavier scratches (I have never needed or used #3). They are available from Antique Electronic Supply (I have no connection with Antique Electronic Supply except as a satisfied customer)

BTW, Novus products are also good for cleaning and removing scratches from CDs and DVDs.

As to NiMH batteries, I use the Kodak brand (pre-charged) 2100Mah batteries in my G5. They give about 25 to 28 hours on a charge before the radio shuts off. I have had no problem charging them in the radio, except that it takes too long. I have found that the Digital Concepts brand (like the inexpensive batteries that are sent out with the Kaito/Degen radios apparently) do not have very good quality control, so that out of a set of 4, at least 1 is likely to not be up to par. So far, no problem with the 4 sets of the Kodak batteries. Being precharged, they are probably tested at the same time. They also seem to hold a charge longer than the DigitalCconcepts batteries when not in use. Of course, your mileage may vary!

I mostly use my G5 on battery power, and will probably do the same with the KA1103.

1927. Question

Yahoo group: de1103
Date: 2008-10-13 16:07:48 UTC
From: Martin
Topic: 1927 Message: 1927

Hi Guys. I have been reading the archived messages on the web page, and after seeing some of them I have a question. Does the external antenna jack attenuate signals like the one on the E5/G5 radios? This is a "feature" that is not mentioned in my G5 manual, but I was told via an email from Eton that the external antenna jack "attenuates signals so as to prevent strong signals from overloading the radio when using an external antenna".

Of course, this may just mean that the external antenna jack is connected later in the RF chain than the whip.

The whip antenna has an amplifier, which is by-passed when using the jack.

1929. External AM Antenna

Yahoo group: de1103
Date: 2008-10-16 23:37:34 UTC
From: Gordon Cooper
Topic: 1929 Message: 1929

I ordered a DE200 mw antenna early in the month, and it arrived yesterday. I'd not used a steerable antenna system in a long time, and wasn't at all sure it would make much of a difference.

Well, it did. About 3 bars worth on the signal meter. Careful tuning of the capacitance knob on the antenna helped peak signals. By some careful steering of the antenna, I was able to almost entirely null out several interfering stations. I was able to find many more stations at night, and listen to them relatively free of undesired stations.

(The 200 is the Degen external am antenna made as a small circular loop, not the rectangular mw antenna booster made out of hard wood.)

From: Bob Yorston
Topic: 1930 Message: 1930

Hi - I'm another newcomer - having tried 21951 - interesting - it worked, but whenever in that mode, everything was severly attenuated - is a section of the front end disconnected? Also, is a service manual &/or schematic available? (Should give some valuable information, but I admit I haven't fully browsed the archives!) Regards, Bob, VK2CAN.

I often wonder how the AN-200 / DE-200 compares to the Terk AM-1000 loop.

The Terk looks to be similar in size, so they are likely similar in
performance.

I assume you guys are talking about the Tecsun AN-200 loop? I have compared that with the Degen Wooden Loop, the Terk AM Advantage and the Select-A-Tenna Model M. They are too clsoe to discern any differences in performance, which would make sense since they are about the same size and have the same capture area. Passive loops of this size should all perform similarly and these all do. The only passive loop I have which materially outperforms them is the MTM Scientific which again makes sense as it is aproximately twice the size of the smaller loops.

1935. Router recomendations

Yahoo group: de1103
Date: 2008-10-27 23:27:59 UTC
From: martin
Topic: 1935 Message: 1935

Hi Guys. Can anyone recommend a wired Ethernet router that does not produce RF in the HF frequency range? I have an older Belkin router here. It wasn't a problem when I had dial-up internet access, because it was only plugged in when I wanted to transfer files between computers. Now that I have broadband (cable) internet the router needs to be on most of the time.

While the RF is not too bad, it is annoying, and does wipe out some weak signals. I might replace it if I could find one that doesn't [produce RF noise in the HF spectrum. I have tried ferite choked on all the Ethernet cables, and the power cord, but that didn't help. Apparently the noise is radiated from the router itself.

I would be grateful for any suggestions of brands/models of routers to try.

Thanks.

The noise that a computer bit seems to always add to a signal is
certainly not good for reception or anything else. It would seem to me
that one solution would be to build an optical router using a fiber
light pipe carrying a signal in two directions. I'd be surprised if some
amateur radio operator had not cobbled something like this together.

I think you will find the router will only be part of the problem, the computer itself puts out quite a lot of noise.

1938. Router problem solved

Yahoo group: de1103
Date: 2008-10-28 15:54:49 UTC
From: martin
Topic: 1938 Message: 1938

Hi Guys. Thr router noise problem has been solved. As some suggested, it was the dirty switching power supply. I had an old Triplite 12Vdc 7 amp supply which I had rebuilt into an 18.75 volt 3.5 amp supply (the main board had failed years before)for use with a laptop computer. I used an LM338 5 amp adjustable voltage regulator, and so was able to adjust the voltage down to 5 volts to run the router. Now I only hear noise from the router if the radio is within a few inches of it.

So if you have a similar problem, it may be the power supply, even if the noise goes away when you unplug the supply from the router (or other device) and the power supply is still plugged in.

Thanks for all the suggestions!

Martin; I've not done the RF noise witch hunt yet, but from all my reading, the culprit is mostly the switching power supply feeding the router. You can easily confirm this by replacing the AC supply with an old-style transformer unit.

-Mark

Hi Mark. I did just that (see my previous post). No more noise from
the router, now to get to work on the pesky cable modem...it has a
transformer type power supply.

1947. Band Stops.

Yahoo group: de1103
Date: 2008-11-07 11:51:41 UTC
From: bobyorston
Topic: 1947 Message: 1947

I've got used to the volume control - I've got used to the pointer, and everything else about the DE1103, but - please! Has anyone got a solution to how you can continuously tune from 100kHz to 29,999kHz - to get rid of those Band Stops? (Hopefully, this has come up somewhere, and I've missed it!)

Look in this groups file section. The file titled Extended has the
info you need. Have fun.

Thanks, but - if you mean the file "1103 extendet.txt" - I am aware
of that, and use it - what bugs me is - if I am tuned to 4100kHz and
want to go up to 4101kHz and above, I have to enter in a new
frequency, rather than just continue turning the tuning knob - that's
what I meant by "Band Stops"!

1950. BF861b's needed

My DE1103 went deaf. Anyone have a couple of BF861B's that I can buy ?
I can get 'em off eBAy but I don't need 100 of them.
Reply direct by e-mail please.

I know I can get them from RS Components, Digikey or eBay but I'm trying to avoid paying over $6 each instead of $0.55 each (after shipping & handling, minimum order premiums ect. are factored in).

I guess I'm looking for someone who may have bought the eBay deal that is willing to sell me 2 of the 99 pcs that they have leftover for a reasonable price. That would defray their overall cost and make me happy :)

Thanks.

No solution; I share your gripe and the fact that I may be in SSB
mode between bands (utilities) and the mode switches to AM when
captured by a band.

A suggestion: program some memories with the start and/or ends of the
between bands. I programmed memories 80, 60, 40, 30, 20, 18, 15, 11,
10 with a frequency in the respective ham meter bands in SSB mode
plus one other for 160m that couldn't match since it is out of the
range of acceptable hexadecimal values.

From: Tom Holden VE3MEO
Topic: 1958 Message: 1958

I assume 'B' stands for Balun as it drives a push pull balanced mixer.
Any idea what its inductance and turns ratio might be? I'm trying to
model the input network in LTspice.

My apologies to "disklog" - yes, it does work, but I tend not to use that mode normally, because everything from 100 to 1700kHz is attenuated - I guess the DE1103 only uses the telescopic antenna in the "opened-up" mode' rather than the amplified ferrite rod - is there a solution for this?

1961. 30 - 40MHz.

Yahoo group: de1103
Date: 2008-11-09 12:26:47 UTC
From: bobyorston
Topic: 1961 Message: 1961

Either I've done the wrong thing (again!) but while 0-30MHz works fine, 30-40MHz is actually receiving 10-20MHz on my DE1103! I first started to get curious when a strong Chinese station came up on 35.44MHz, while a scanner didn't find anything there, but the scanner did find the same station on 15.44MHz! Sure enough, WWV came up on 30 and 35MHz (actually 10 and 15MHz), so I left the receiver tuned to 35MHz and grabbed a signal generator - you guessed it, nothing when I set the sig gen to 35MHz or anywhere around it, plenty of signal when I set the sig gen to 15MHz and 7.5MHz (2nd harmonic). For me, at least, this mod doesn't do what it's supposed to!

1962. Re: 30 - 40MHz.

Yahoo group: de1103

From: Tom Holden VE3MEO
Topic: 1961 Message: 1962

The mod probably does what it is supposed to. The receiver doen not do what you need and that is filter out all the spectrum except that which you want nor generate any spurious harmonic and intermord products. As far as I am concerned, my KA1103 is notoriously poor in these aspects in its intended tuning range. Strong signals overload either the preamp or the mixer and generate harmonics and intermod. 2nd IF images are strrong on the MW band and the LW band, appearing 900kHz below the transmitter frequency. The 1st Local Oscillator or the mixer generates spurs that result in unstable images of the lower half of the SW spectrum popping up in the 20-30MHz region, along with other unidentifiable crap probably coming from inside the set.

You'll need to add a 20-30 MHz high-pass filter or a 20-40MHz bandpass filter at the antenna input to clean up your reception of the 30-40MHz range.

Good luck,
Tom

Hi. For that price, I would probably order more than 1! I would
probably order 10. That way yoiu have a few spares if you ever need them.

1964. Schematics for revised versions?

Yahoo group: de1103
Date: 2008-11-11 02:32:14 UTC
From: Tom Holden VE3MEO
Topic: 1964 Message: 1964

Has anyone got a schematic for any of the revised versions? I believe current production of the main board is at Mark IV which implies there may have been up to 5 versions: original (un-Marked) and 3 (if original was implicitly Mark 1) or 4 (if Mark 1 was a revision) later ones.

I have been trying to model wind_nv's modification of the low-pass filter at the input of the mixer and apply it to the 1103 schematic but find the description has part numbers that do not exist or do not correspond with the only schematic I have found (the one watermarked russianscanner is identical to the non-watermarked one on the French website).

It would be really great if this website had schematics for all versions of the 1103 available.

Tom

1966. Miracle Whip and the 1103

Yahoo group: de1103
Date: 2008-11-13 04:57:00 UTC
From: Tom Holden VE3MEO
Topic: 1966 Message: 1966

The Miracle Whip antenna (http://www.miracleantenna.com/MiracleWhip.html) is a 57in. telescoping whip with a one-knob tuner for impedance matching. While aimed at the low-power portable ham transceiver market, it also is of interest to SWL's as it can provide remarkable gain over an untuned short antenna. The manufacturer claims up to 30-40dB advantage over much shorter antennas like rubber duckies. I was given one along with a Yaesu FT-817 transceiver and would otherwise not be putting it together with my KA1103 as it costs twice the price of the radio!

Why bother with the Miracle Whip when the 1103 already has a very sensitive 32 in. whip? My 1103 suffers from intermodulation products and harmonics internally generated from strong MW stations appearing in the SW band. It also gets image interference from VHF-FM and possibly low-band VHF-TV signals. I thought the tuned antenna would help to discriminate against these unwanted signals and their offensive byproducts.

Now I doubt that my 1103 is very much different from other unmodified ones. So my observations and conclusions ought to be valid for those in urban environments with strong local stations. I'm in Toronto. Moreover, if the 1103 is so susceptible to overload and the generation of unwanted products, there will likely be a lot of unidentifiable interference being generated not only from MW and VHF sources but also from SW signals. So for digging DX out of the mud, reducing the mud and elevating the desired signal seems the right thing to do.

Directly hooking the Miracle Whip into the antenna jack produced unanticipated and disappointing results. Tuning it was ambiguous as one might be peaking intermod products instead of the desired frequency range. Indeed, I had one set of IM products pop up around 5MHz from the local 1010 and 1050 kHz stations that corresponded with the peak for 5MHz - these products were not evident with the 1103's whip.

The MiWh tuning element is not your typical LC network - there's no C and the L is a continuously variable autotransformer (CVAT). So unlike the typical Pi or T or other LC network, there is no inherent low-pass or high-pass filtering. While there must be some degree of selectivity introduced by the match, there may be other spurious responses. The 1103 looks to have a high impedance at the antenna jack, probably 400R with the attenuator on and a high reactive impedance with it off. The MiWh designer allowed that the CVAT would not provide much selectivity into a high impedance.

I interjected my MFJ-901B transmitting antenna tuner - a T network high pass filter comprising 10-324pF air variables in series on input and output and a 17-18uH tapped coil to ground in between. That helped to reduce the MW products but also killed 160m and weakened 80m more than I liked.

Then I stuck a 1:9 impedance transformer between the MFJ and the radio. That boosted signals but 160m was still weaker than needed. The 1:9 was an Erickson Engineering 9:1 intended for an end-fed long wire antenna used in the opposite direction.

I figured a preselector would be better than the T-net antenna tuner at suppressing unwanted energy both above and below the desired freq range. Lacking one, I converted the MFJ-901B by grounding the caps in parallel with the inductor. Using the same config as before, I got similar results and was disappointed at how broad its peak was.

Did some calculations and realised that the modified MFJ would be more selective if it was operating with a high source and load impedance. Moved the 1:9 ahead of the preselector and voila! Selectivity! 160m popped up in level such that the attenuator needs to be on. It is so selective that the preselector peak is narrower than the bandwidth of any of the ham bands from 160m to 40m.

There was, however, still some residual 2nd harmonic from the MW stations. A 1.7MHz high pass filter would help. For the moment, simply inserting an 82pF cap in series between the 1:9 and the preselector dropped them out of sight. I think upgrading that to a 3-element Chebyshev filter will provide some extra margin.

VHF-FM images remain a problem, and are present even with the input jack terminated in a 50 ohm load, indicating ingress directly into the pc board that only shielding can solve. Nonetheless, it is worse with the antenna so I plan to add a 33Mhz Butterworth (ripple free) low pass filter after the preselector. The radio's low pass filter, according to LTspice simulations I have done has a lot of ripple already around 25MHz that would be compounded by adding a more aggressive Chebyshev pre-filter.

The preselector runs out of range at about 17-18MHz. Not sure why that is as that runs counter to the simulation. But the radio suffers from so many birdies and images above here that it discourages one from using the upper frequencies.

So the Miracle Whip may not be a great choice for the 1103 as you have to interface so much more in between to make the radio really fly. I do get substantially higher levels from this system than from the built-in whip and preamp and the unwanted MW byproducts have been eliminated or subtsantially reduced. Moreover, it has been a good learning experience for me and I now have a prototype for what I may build as an interface for any external antenna:

bypassable 1:9 -- 1.7MHz HPF -- bypassable preselector -- 33MHz LPF -- 1103 ant jack

I would use 450 ohms as the target design impedance from the ouput of the 1:9 to the radio.

Hope this was of some interest; it must have been if you read this far!

Good reading Tom. The other way to go with this would be a tunable loop. Providing the loop's circuit doesn't suffer from bad IP2 & IP3, resonating the loop will act as a bypass for the bad guys. A 3ft remotely tuned roof-mount active loop will be my springtime antenna project. For the winter, I just erected a 100ft sloper and tried the antenna both directly into the 1103 and thru a 9:1 unun. Couldn't tell any difference on first round of tests but wired the 9:1 into place anyway. Want to get back outside & directly connect the 1103 one more time before the snow files to confirm my results. But ya, overloading is a problem here too with the sloper so the gains over an indoor small aperture tuned loop are offset by other issues - at least on the 1103 and Redsun/Kaito 2100.

If you come up with a tunable whip or tuner/bypass filter for the external wire, keep us posted. It would seem to me this would be a popular item considering the proliferation of lower cost new radios with hot circuits but wide open front ends.

Have you seen the Langford mod to the 2010? He built a tunable circuit for the 2010's whip and installed it inside the 2010. That might be worth looking at for ideas. I don't recall the URL where I found the file but can email you the PDF if you'd like.

-Mark

1968. Re: Miracle Whip and the 1103

Yahoo group: de1103
Date: 2008-11-13 20:58:58 UTC
From: Tom Holden VE3MEO
Topic: 1966 Message: 1968

Thanks for the comments, Mark.

I agree with you about the tunable loop. Does anyone know how the DE31 stacks up in the IP department? It's certainly transportable with just one knob to tweak but not self-supporting.

Assuming you are feeding the sloper via co-ax to the 9:1 unun mounted at the antenna, you might want to add a 1:9 at the input of the 1103. Then you can insert any devices in between intended for 50 Ohm in/out, e.g., HPF, conventional preselector, and have it work more or less as intended. Of course the antenna impedance is going to be all over the map at different frequencies but, on average, high. And so the impedance on the low side of the unun is going to range widely around something like a 50Ohm average and the devices will be affected accordingly.

Good luck on the remotely tuned loop project. That may have to be my solution, too, for a fixed antenna. But I still want to transmit from home with my FT817 and need to do something a little more efficient.

I think one has to be wary about building bricks to make these little radios work the way we want. What's the point of a small radio if it's anchored to its accessories?

Thanks for the tip on Dallas Lankford's tuned whip mod for the 2010. I found undocumented references to it using Google and think I found what you meant in the Files of the icf2010 Yahoo group which I joined just for this purpose. It's titled:
"Sony 2010-X (Corrected) And -XA (Tuned Whip Mods)
Dallas Lankford 12/2/06, rev. 4/4/07"
It looks like the 2010 is substantially larger than the 1103; adding three more controls to the latter may be next to impossible! Anyway, it will make for an interesting read.

1969. DE1103 Battery Life

Yahoo group: de1103
Date: 2008-11-13 19:40:55 UTC
From: Tom Welch
Topic: 1969 Message: 1969

I just got a DE1103 from China this morning and have one question: What kind of battery life can I expect from regular AAs and rechargeable AAs?

I have the Sanyo 2000mAH AA rechargeables and charger setup.

Thank you,
Tom Welch > Author, Consultant and Researcher

1970. Hands off my 1103! (desensitizes it)

Yahoo group: de1103
Date: 2008-11-14 00:31:06 UTC
From: old_speaker_guy
Topic: 1970 Message: 1970

I'm happy with my 1103 but it has a quirk. I wonder if anyone else has seen a similar problem. If I place my hand on the back side in the upper right corner (viewed from the front) it can loose sensitivity to the point were a medium strength MW signal disappears.

It isn't frequency drifting as verified by turning on the SSB BFO and listening for pitch shift. There isn't any. Signal strength may come back if I take my hand away or I may need to tune off station and then back to get it to return. It works fine on a table top but I can't place it on my lap.

This isn't a loose connection, I'm not tapping the radio. The same effect happens if I just bring my hand up to, but not touching the surface.

My magnetic personality??

I have the opposite problem with my 1103. If I put my hand on the front metal bezel the signals come up. The S/W sensitivity off the whip seems low compared to my recently acquired G5. The 1103 has been like that since I bought it used and I now suspect that the pre-amp FET (Q1) is pooched and the ground plane effect that I'm observing is related. A replacement FET is enroute so I will report any changes or improvements after I swap it out.

Hi Guys. Hugh, I have the same effect with my 1103...althgough it is about a month old, and I am sure that the pre-amp is fine. It picks up a lot of signals on the whip, and sensitivity is a very close match to my G5.

David, I have notices that if I touch the whip on my girlfriend's Kaito WRX911 that signals drop off significantly. It works pretty well as long as I don't touch the whip. Are you maybe touching the mounting screw for the whip? it is in the area you indicated.

I did do the anti-static diode mod to my G5. I found the circuit on a couple of web sites. I used 1n914 diodes as these were recommended on the web sites. I should have taken pictures, but I didn't think of it at the time. Kiwa sells a kit to do the same upgrade.

Pressing the front of mine slightly causes the frequency to shift slightly.

I'm pretty confident that the pre-amp is shot on my 1103. My G5 is much
more sensitive off the whip.
I though the ground plane effect which improves sensitivity when
touching the front bezel might be related but
I guess that's normal.

I do not notice a shift in frequency as Leon is experiencing, just an
improvement in sensitivity.

1977. Radio case

Yahoo group: de1103
Date: 2008-11-14 17:06:17 UTC
From: martin
Topic: 1970 Message: 1977

Hi Folks. I just received the radio case that I ordered from tquchina on eBay. It is a carry pouch with a flap, or as some call them a wrap around. It is not as well padded as the case that came with my G5, but it is similar otherwise. It is much better than the bag with string tie that came with my KA-1103. Not bad at all for $10.99 (international shipping included). It fits the radio well, and is lined with soft material. I think the design is slightly odd. The radio is obviously meant to fit with the face towards what I consider the back of the case. It fits either way however, and this is not bothersome.

I am well please with this carry pouch.

1978. Home-made reel antenna

Yahoo group: de1103
Date: 2008-11-14 20:05:06 UTC
From: martin
Topic: 1970 Message: 1978

Hi Guys. I just uploaded two pics of a home-made reel antenna. The wire and the clip came from the 33 foot antenna that came with my Kaito KA-1103. I got the idea from the yo-yo antenna design. The reel just twists apart. The only extra materials were the two short hunks of heat-shrink tubing that I added to keep the knots in the hanging cord from coming undone.

Just an idea for those that like to roll your own!

No, thats the odd thing. Just bringing my hand up to the area without
touching anything makeas the sensitivity change pretty dramatically.

David, I think this is just the effect of your body adding some capacitance to earth in the vicinity of the unscreened, high impedance RF and maybe IF amp circuits. If they were low impedance, you would see little effect. Making contact with the base of the antenna adds the greatest capacitance but you will note the level dropping even as you bring your hand near, especially if you are listening to a weak signal that does not show on the meter, so that the automatic gain (volume) control is inactive. Bringing your hand near the printed circuit board adds capacitance to all the traces; the high impedance circuits being affected the most.

I forgot to account for the distributed capacitance of the approx. 8ft of RG-59 co-ax I had used in the hookup on the high impedance side of the 1:9 unun. At ~19pF/foot, it adds up pretty fast; 150pF in parallel with the 20-648pF total variable meant the C could range from 170-800pF, not 20-648pF. Shortening to about 16" total (~26pF)supports peaking up to about 28MHz. Integrating the 1:9 in with the preselector will reduce this residual to that of one even shorter length and it should peak all the way to 30MHz.

Nonetheless, I'm still having difficulty getting my LTspice simulation to behave exactly the way I observe the preselector to. There remain some anomalies.

Hi Guys. I was listening at various times today on 11092.5 with both my KA1103, and my G5. I hear the broadcast to Japan (very weak signal on both radios) using my 80M dipole. It is about 15 feet high at the center, and about 9 feet at each end. I also hear the broadcast to Europe (slightly better signal) on both radios. O could not hear the broadcast to japan on either radio on the whip antenna.s I could just barely hear the broadcast to Europe on both radios on the whip antennas

At 22:30 UTC, the signal disappeared entirely for about 15 minutes. Then it cam in fairly well on the 80M dipole. I still had a listen able signal using the whip antennas, and could just barely hear the signa when I collapsed the whips and folded them down.

The performance of the two radios was almost identical. I am pleased with both radios, but I prefer the memory system on the KA1103.

I am listening to Radio Australia on 17785Khz right now using the 80M dipole. I can pick up the signal on the whip, but it is kinda noisy at times.

1985. Mod for faster AGC - any experience?

Yahoo group: de1103
Date: 2008-11-16 22:30:10 UTC
From: Tom Holden VE3MEO
Topic: 1985 Message: 1985

There's a Russian mod that proposes replacing 10uF C206 with a 1uF.

Has anybody on the board done the AGC mod?

What effect did it have for you?

Would you recommend any alteration to the mod?

I have always been bothered by the slow AGC attack speed - tune to a strong signal and there's an initial surge of distortion until the AGC pulls down the system gain. Listen to SSB voice, and there's a surge of distortion on the beginning of words after a pause.

Examining the schematic, I find that the AGC is developed inside the TA2057N chip and the only external component is a 10uF electrolytic capacitor C206. The datasheet shows an internal 100k in parallel with C206 plus transistors and other resistors with no values. So it's easy to calculate the RC discharge time constant as 1 second but, lacking more information, it's impossible to calculate the charge time constant.

Assuming the discharge time constant controls the AGC release speed (because 1 second would be much too long for attack), what is surprising is that the attack is nonetheless a large proportion of the release speed, else we would not hear it so readily. Reducing the release time should have a proportionate effect on the attack time. I believe that the attack time should be 5-10% of the release time - much shorter and it is too twitchy, much longer and it does not catch the beginning of a signal quickly enough.

A 1 second release is quite desirable for steady AM signals and is in the range of what is commonly called "Slow AGC". It is preferable to faster AGC to reduce distortion due to AGC tracking of modulation by bass energy. A release on the order of 250 milliseconds is "Medium AGC" and often preferred for SSB speech and Morse code CW when you want to hear between words. A few tens of milliseconds is "Fast AGC" used in data modes or for Morse code CW when you want to hear between the letters, terrible for speech and music because of the high degree of modulation tracking.

The set of Russian modifications suggests replacing C206 with a 1uF capacitor, thus reducing its discharge time constant to 100ms. That seems a bit fast to me - I was thinking that 300ms (2.7 - 3.3uF) would be a good compromise for all modes.

Hi Amar. Lots of folks have trouble charging the batteries that come with the radio in the radio. I think that this is because the batteries that come with the radio are cheap, and the quality control is not very good. I use Kodak (Pre-charged) 1200 Mah NiMH batteries in both my G5 and my KA1103, and have no problems with charging them in the radio. And no, I do not overcharge them. Basically for the 2100Mah batteries, I set the charge time to 21 hours. The battaries have never gotten more than very slightly warm.

I don't recommend charging any batteries too fast. A 12 to 14 hour charger is about right.

I use 1800 Mah batteries, and generally charge them in my smart charger.
The batteries last a very, very long time between charges. The batteries
are slightly warmed but that's all.

Hi Tom,

I think that I have not problems with distortion.

Best regards, Jara "Rat"

Thanks, Jara. I guess that the speech/bass distortion due to AGC tracking remains pretty low below 100 Hz because the attack speed is such a high proportion of the release speed. Were it a Fast Attack (e.g. 5ms), the 100ms Release would have a higher level of distortion.

Has anyone on the forum taken a KA/DE-1103 or other portable shortwave radio to Cuba and had any problem with keeping it?

Canadian government travel advisory says "Articles prohibited from entry into Cuba include drugs, explosives, pornographic material, literature considered subversive, perishable food items, radio transmission equipment, wireless microphones, radio and TV receivers differing from household model,..." (ref: http://www.voyage.gc.ca/dest/report-en.asp?country=69000)

Good point, one advantage is that the radio looks just like any portable transistor.

Paul

2000. Broadband hash/interference; antenna suggestions

Yahoo group: de1103
Date: 2008-12-10 17:25:19 UTC
From: Claudio Leite
Topic: 2000 Message: 2000

Hi,

I'm having MAJOR interference problems with my DE1103 (and the two other SW radios I have) and have tracked it down to a new heating system. It has made SWL'ing impossible except for the strongest of stations, and is spewing broadband noise especially around 7000-17000khz. For example, if I switch the circuit off, WWV comes in on 15mhz and 10mhz, but completely disappears once I turn the circuit back on even if the indoor units are off.

My landlord upgraded the heating system at my house to an LG Multi Zone type unit. I believe these types of heaters are more common in Europe and elsewhere, but are pretty much unknown here in the US. I don't know how to describe it properly, so I'll just link to LG's site:
http://us.lge.com/products/model/detail/home%20appliances_air%20conditioners_multi-zone_LMU180HE.jhtml

I'm not sure that's the exact model but it's very similar. They added a 220V/60A line that runs the length of the house to the back, where it connects to a second breaker box outside. The electrical connections look OK. Switching off the outside breaker box only also makes the noise stop, so it seems to something with the unit itself and not related to the 220V line running inside the house--unless I am wrong that there is still power flowing on that "trunk" line (heavy gauge) when the main breaker is on but the heater's circuit outside is off.

So, long story short, I can't listen to SW anymore. My house is small and so the interference is everywhere; there is no location far enough from the wiring to make the interference stop. It's strong enough to light up the signal meter with the whip fully detracted and the preamp off.

Is anyone familiar with these units? Are these just noisy or is there something wrong? They also use a low-voltage, 4-conductor wire to communicate between the indoor and outdoor units. I'm wondering if they are using these frequencies (or creating noise/harmonics) in their inter-communication. From reading the service manual it seems they do a bit more than just switch the heater on and off.

Interestingly, MW is not affected all that much. I've been doing some MW DX'ing and the noise I hear is coming from the outside, it seems. But if I do the 29151 trick to enable the whip for MW it is noisy again. I wonder, does this have to do with the magnetic loopstick rejecting noise better? If so, is there any reason I couldn't make a loopstick for higher frequencies? I couldn't find much in the way of SW loopsticks via Google.

Note that I have the DE31 and it doesn't help much. I'm confused as to whether or not it classifies as a true magnetic loop since the design is a bit confusing (for me). Plus, having to tune the antenna takes away the fun of scanning the bands manually.

Thanks for reading, and sorry for the long post--I'm just a bit frustrated. I got the DE1103 back in April and got back into SWL'ing then, and already I'm no longer able to listen.

2001. Re: Broadband hash/interference; BPL etc..

Yahoo group: de1103
Date: 2008-12-10 18:20:31 UTC
From: Hugh Duff
Topic: 2000 Message: 2001

Sounds similar to the wireless network adapters that you can buy to set up a "wireless" (non-RF like WiFi uses) network for your home. They inject data at the zero crossing of the A/C signal which turns your home A/C wiring into a "wired" network (ala "X10" except X10 uses very short data packets only when a command is issued so there is no problem with constant broadband noise).

Then of course there's "Broadband over PowerLine" (BPL) issue in North America.
Someone decided that we need yet another means to provide high speed data service aside from cable, DSL and satellite. Well the infrastructure is already in place... let's superimpose data onto power lines throughout a city ! Sounds great ...BUT... it was soon discovered that this scheme generates RFI in various parts of the RF spectrum, enough to render certain means of communications useless. The power distribution lines make for a great antenna and there is no escaping the interference when it's coming in on your A/C power lines.

Needless to say BPL is very unpopular with Radio Hams and in fact the ARRL (American Radio Relay League), RAC (Radio Amateurs of Canada) and other groups have formed study groups and are now fighting against the widespread use of BPL.

Some power companies are using the A/C lines for data acquisition... they no longer need to send out a meter maid to take a reading from your hydro meter on the side of your home. Here again is a form of BPL.

Time to move ?

I'm not sure it's something of this nature since the indoor units do not have AC connections at all. They get power from the low-voltage, four-conductor line which I believe provides 36V DC.

I might try disconnecting the wires to the indoor units while maintaining the 220V AC line on. That should help me identify the problem better. Unfortunately I am also having actual heating problems with the system and the HVAC guy will be here soon so I don't want to mess around too much.

It's not power-company/BPL related since it goes away when I switch off the breaker to that particular circuit. There is still some noise but it's tolerable and has always been there. The power company must use some sort of remote metering but it doesn't seem to cause problems. DC is well-served by cable and DSL and I've never heard of any Internet BPL projects planned here.

Thanks.

Claudio - Sorry to hear of the noise at your location. Sorry, I have no direct experience to help you but can answer that yes, the DE31 is a true loop. It is active not passive in that there are electronics used. But by design, it is still a loop and has the figure 8 pattern to help you steer away from noise. However, since your noise seems to permeate your environment, a directional antenna is not helping you. I'm not sure abt the "29151 trick". Have you taken the radio outside and walked around the yard. Might be good to confirm the noise is not coming from a nearby power pole. With that knowledge, you at leat have narrowed the noise source.

Keep us posted.

Mark

Hi Claudio. This sounds lie the unit may be defective. Either way, it should be classified as an unintentional radiator, and therefore there are strict limits on how much RF it can emit. I would see how far the noise can be heard outside your home.

Hi Mark -

There is definitely some neighborhood noise, so if I take the radio outside there is still some noise. That's been there as long as I've had the radio. But the new noise goes away entirely when I switch off the breaker to the heater, so it's definitely coming from inside my house.

The 29151 trick (number might be wrong--recalled from memory) is the "extended range" trick found in the files section of the Yahoo group. It lets you tune down to 0khz and also turns off the internal loopstick for LW/MW and turns on the whip/external antenna on all frequencies. I've used it with a longwire in a quiet environment to listen to MW with good results, and it also works with the DE31 in MW mode better than by coupling it with the included ferrite coil.

Thanks for clarifying the design of the DE31. I'll also experiment with tuned passive loops. I imagine the pickup loop would itself pick up the noise since it is so strong that any length of wire picks up some of the heater noise when connected to the antenna jack.

Thanks for your response.
-Claudio

If it generates that much noise I can't see how it got approved. You should get it changed.

I agree; I don't see how it got approved. It's radiating pretty far from the unit itself and is probably affecting my neighbors, too, but not at the same extreme level it's affecting me.

I also forgot to note earlier that it's also causing interference on my TV, but not on broadcast frequencies but rather on baseband component video signals.

I'm really hoping the heating problems I'm having with the unit are also an indication that something is defective. However, I found this site: http://homepages.udayton.edu/~zabarnss/RFI.html

plus a bunch of other discussions online about furnaces causing problems. It doesn't give me much hope about addressing it as an unintentional radiator if other units are having similar problems and getting approved nevertheless.

It does give me some hope that at least one person has gotten around a similar noise problem with toroids. Being a renter I doubt my landlord would agree to change the unit unless it's defective, but I could probably do some filtering myself.

I'll see what happens after the HVAC guy comes by to check on the heating problem, and demonstrate the noise problem as well. Maybe there is something the manufacturer provides that I could install.

Thanks to everyone for your input.

I'm back home with the KA1103 intact, no problem at airport security or customs - carry on bag not even inspected other than x-ray. Reception was great on the beach the one time I took it there but virtually impossible back in the room or on the balcony of the Hotel Playa Costa Verde, except for a handful of very strong stations. All the lighting is fluorescent after a recent national conversion program and probable additional sources are the air conditioning, keycard door entry and keycard master electrical switch that are controlled over a wired network.

Radio Marti or other offshore Spanish language station was by far the strongest SW signal, at times breaking through the RFI and also overwhelming the buzzsaw jammer. Couldn't get RCI except on the beach. Also on the beach 20m was pretty good - nice signal from a Swiss SSB - and some sigs on 15m. Also picked up a strong Canadian aeronautical weather station above 15MHz with weather for Victoria, Abbotsford and Comox, BC.

From: Claudio Leite
Topic: 2000 Message: 2009

Hello again,

My heat isn't yet fixed (and it's rather cold) but I think I may have at least brought the noise level down a bit. I had the furnace off for the past two nights and monitored the bands to see what conditions were like at this time of year. I bought the DX Engineering snap-on ferrite choke assortment pack (around $40) a few days back and it arrived today. I put them quite haphazardly on the "trunk" AC line, the outdoors AC line from the breaker to the unit and two on each thermostat line. The noise is noticeably weaker as far as I can tell. It only peaks up once you get near the indoor units, and I might be able to help that further by placing some of the chokes on the indoor end of the thermostat lines and by more carefully placing the chokes in general. But that's a project for another day, after the heat is back on.

Looks like all hope is not lost! I'll have to test it a bit further but this is a good development.

Thanks again, everyone.

I can imagine three or four possible sources of interference:

1. The 36VDC lines from the outside unit to the inside units is from a switched-mode power supply.

2. The communications and control signal wiring is radiating - maybe it's supposed to be balanced and is improperly installed or it's an unbalanced system. If the latter, shielded wiring should help but might adversely affect the max allowable length.

3. Each unit has its own microcontroller and they are radiating.

4. The wireless energy management option clearly radiates but I think you have indicated you have wired thermostats so this would be ruled out.

Good luck with your ferrite adventure...

Tom

Hi,

I'm not going to deny that ferrites seem like an all-too-easy solution, but if it gave me some positive result, I'll take it.

Some folks on eHam also reported success with correctly-placed ferrites. They were different types of units, though. But they were "high-efficiency" models that seem to share some characteristics with my unit.

You are probably right about #1 and #3. I don't think I'll ever get rid of the noise when close to the units. The control wiring is correct; I triple-checked it against the manual and re-did all the connections just in case. If only the control wires radiate and don't cause the AC wire to radiate I'm OK, since they are both at one end of the house. I can just move away from that side.

I'm not too strong on theory (yet) but it seems to be working, so I'm (cautiously) pleased.

Thanks,
-Claudio

Dear 1103 Users:

I have a G4 iMac and it is so noisy that I can't bring my 1103 into the same room and get a usable signal on any band other than fm. This has really messed up my plans to use a Tigertronics Signal Link in line with the 1103 so I can decode Hellschreiber, TTY, etc.

Any suggestions? I have already tried using in line common mode signal isolator and it makes no difference at all in the noise. At this point I'd be willing to wrap the whole computer in foil and ground the thing if that would help.

Any suggestions folks?

Hi Gordon. I have only seen a pic of your computer. I am not an apple fan. Is the base plastic or metal? If its plastic, that could be part of the problem. Does it have an external power supply?

From the looks of the computer, the only option may be to wrap it in foil and ground the foil.

Why the tigertronics interface? All you need is a simple audio cable. A better option may be to find an older IBM compatible computer, say a PIII 700Mhz with 256 meg of ram, and a 6 gig or larger hard drive. Put Linux on it, and you are all set.

Just my thoughts...

Using a simple audio cable, even with a filter, there was too much noise
to hear anything. The base of the Apple iMac is metal, the shell is
plastic. The computer has an internal power supply.

I do not have the same problem when I use my RP2100. Will wait for
sunset and some cw or tty signals to come booming in and test the
Tigertronics interface with the 2100.

Gord,

Are you using an outside the dwelling antenna, with a co-ax feed line
and a common-mode choke on the feedline?

Is the problem only when you connect the radio to the computer? A
transformer would help.

Are you running the radios on battery or on AC? Use battery to avoid
power line coupling.

If RP2100 OK, then looks like an 1103 issue - maybe lack of shielding
of front end.

Killing the problem at source is always best approach. Shielding the
computer/monitor is impracticable after manufacture. Is it a CRT
display? If so, can you replace it with LCD? If the source is CPU
power supply, then breaking into it and doing suppression measures
may be effective.

Hi Gordon,

The only major thing I can think of would be a bad power supply. My experience has been that hard drives and other components only cause interference within a small radius. I'm guessing since it's a G4 iMac that it's one of the lamp-like LCD models? I do think you can buy replacement power supplies (eBay, iFixIt.com) but I don't know how you could trace/confirm the problem before buying a replacement.

Then again, if another radio is OK, it might be the DE1103's shielding. The guys at radioscanner.ru have instructions on how to better shield the DE1103. Unfortunately, they are in Russian. I might try that sometime if I trust a machine translation of it. The translation was very rough but I think they said it was a worthwhile improvement. Obviously you'd need to do a cost-benefit analysis on that.

I personally use(d) CocoaModem with my MacBook Pro with good results but I use a 1:1 audio transformer and move the radio away from the computer. Placing the transformer closer to the computer than to the radio seems to help. It also helps to use a wire or other antenna instead of the whip, even in the same part of the room. I suppose the SignaLink shouldn't need these workarounds but at least my DE1103 seems to use a cable plugged into line-out as an antenna unless there is something in the external antenna jack.

Hope this helps.
73, Claudio

Dear Tom:

The antenna is indoors. There is no way to get an outside antenna in
this apartment without an awful lot of expense and discomfort.

I am running the radio on battery. The 1103 does seem to use any wire
hooked to it as an antenna, or at least a noise source.

Sticking the Audio System Ground Loop Isolator removes some of the
static, but not all of it.

My iMac has a dead lcd monitory, so I am using an external lcd monitor.

My plan is to replace the iMac with a Linux box as soon as practical, and build the box to have as little rf as possible.

Some of my electronics are very noisy. The switching power supply for my previous cell phone screamed like a banshee across the whole hf spectrum. I've turned off all of the breakers and there still is rf noise in the apartment, much of it from the junction box that is outside my kitchen. I called in a complaint to the power company, so they sent out a technician who looked at the box for about twenty seconds, returned to the company van, and left.

Tough situation, Gord. If at all possible, get even a tiny antenna
(as long as the 1103 whip) out the window. Can you dangle a wire from
the window? Feeding it with shielded co-ax is required but the
connection to the antenna is problematic if you don't have access to
a good ground point. You could make a really short dipole and feed it
via a balun (1:9 or higher is better) - sounds like TV rabbit ears!

Adding a common-mode choke on the co-ax close to the cable exit would
also be advisable to help suppress propagation of interior noise

sources up the shield onto the antenna.

Have you looked at the PA0RDT Mini-Whip? Could that be mounted outside?

The Audio System Ground Loop Isolator is probably a transformer but may have significant capacitive coupling across it at RF. Try adding some ferrite chokes on these lines close to the source. Glad to hear your confirmation that it has helped.

Sounds like you are on the right track with the computer.

As you reduce one cause, you'll hit a limit that's due to another. It will take many small steps and you'll come up against the law of diminishing returns.

Good luck!

Tom

Dear Tom:

I can probably thread a very small insulated wire out the 2nd story
window. As for a ground, the Puget Sound is my back yard, and I could
run another wire to that with no problem if that would improve the signal.

All I need is a relatively clean receiver that will output an audio
signal that can be decoded- PSK31, TTY, Hell, etc. via my computer.
Short wave listening is also a lot of fun on this coast-The Australian
news intended for Papua, N.G. is in pidgin English in the early morning
hours, a listening experience which is a lot like a visit to 1960's
California without the chemical accessories.

73,

Gordon Cooper

Dear Tom:

Interesting, this does look something like my idea of an ergonomic DE1103. I would not have expected synchronous detection, given that neither of the Kchibo portables with synch detection were any better than the 1103 in use. In reviews I have seen the 1103 reviewed more favorably than the Sony world radio with synch.

I wonder if this will be available from China?

73 for the holidays,

Gordon Cooper

Also as a side OT, has anyone seen the new grundig g6 aviator? Kinda like a miniturized g5 w/aviation band/ssb, but no dedicated lsb/usb switch and only one bandwidth.

Hi Tom. A lot of places have been sold out of the G5 for a while now. Seem to be plenty of KA1103s available though. I like the memory system better on the KA1103, except for the "hidden"memories. I find myseld using my KA1103 more than I use the G5. I did open up my KA1103 (purchased in September), and it does have protection diodes. It does not have the modified board, they are just soldered in between the antenna connection and chassis ground.

Thought I'd ask again if anyone here has tried out the grundig g6 and
what ya'll thought of that one. It's like they took some controls off
of the g5 and made it smaller.

Yeah I read the reviews. Mixed. But alas since my 1103 got sold 2 months ago because of the dreaded blown FET so being out of warrenty, and deaf I sold it. So, I got the g6 as an early xmas gift and really, it has quirks but is a fun fun little radio. Some people think it's too sensitive and thus overloads but I just don't put a long wire on mine. Now I've never seen an 1102 but I'd bet the g6 is at least that small. It's about the size of the old Sangean 606. SSB is off or on, you have to tune to get lsb/usb. Audio has a tiny bit less bass than the 1103. Its' memory scheme is very much like the g5. you get 99 pages of 7 memories each.

From: martin
Topic: 2020 Message: 2029

Hi Pete. I bought one that had the FEt blown, and replaced the FET. I also added some diodes for static protection. I sold it to a friend, who really likes it (I got the radio with this friend in mind). Replacing the FET is not something I would recommend unless you have some electronic repair experience. Glad you are having fun with the G6. That you are satisfied with it is the only thing that really matters.

Not sure whether I would like it or not...would have to see one, and get to play a little. I like my G5, but find myself using my KA1103 more than the G5.

Yeah about the FET, I'm not even really sure, just suspected it and
didn't have the means to replace it, being legally blind and not able
to solder w/o burning my nose (part of that being not having the right
magnification equipment). That's the reason I sold the radio
(pawnshop didn't care, it looked like new and worked on am/fm, and for
some reason a lot of SW worked on mine, it was just deaf on certain
frequencies. Couldn't hear anything on 41m for example. And
selectivity seemed to be off everywhere.

That said, I also couldn't get around the volume ergonomics when
trying to use the radio walking around. So when I noticed the
reception problems off it went. I had been holding out for a g5 when
one day saw the g6 @ RS and then came home and read about it. I asked
santa for one and got it. I've have fun with it. I don't know if
kaito/degen had anything to do with the build but it reminds me very
much of the g5. just less controls and small. And definitely a one
handed operational walk around radio too. Only trick being reaching
the hold button with the thumb. I think if you go in knowing you just
want it for the big catches off the whip on sw, you wouldn't walk away
dissappointed. I took a chance on that and was pleasantly suprised.
Maybe not quite as sensitive as the degen/kaitos (1102,1103), but
still pretty good.

Hi Bill. You might be surprised what you can hear. If you don't like
portable shortwave radios, you might be in the wrong group, as this
group is about the Degen De1103, and Kaito KA1103 portable shortwave radios.

RHC, CRI, VOR, Hams, utilities, to name a few, can all come in pretty
good on a portable. Not everyone has the money or space for a
desktop, and some want a radio to carry a part of their hobby with them.

Regarding the G6 ... I have had and used one now for a few months.

I also have an Eton E1XM, Sony 7600G, Degen 1103 and Kaito 1102.

In terms of SW sensitivity, I would place the G6 at the end of the above list. Also many AM BCB images show up here and there on the SW bands. Adding even a short external antenna results is lots of overloading. FM performance is pretty good good in sensitivity and selectivity (better than my 7600G) and nice sounds via headphones. AM BCB seems ok, but mine seems less sensitive below about 800 KHZ. There also seems to be an attenuator that kicks in below 2000 KHZ such that the 160 meter ham band is not picked up well. It will receive sideband signals just fine, but the fine tuning is too slow and the fine tuning is not remembered in either a memory or even if you tune away from a specific frequency. The aircraft band is full of FM images such that it is not too useful for me. I've noticed that my tuning dial tends to jump forward or backward an extra step or two sometimes ... if this worsens I may need to turn it in under warranty.

That's the bad ... the good is that the G6 is very small .. a little smaller than the 1102 ... shirt pocket size. It has most of the functionality of the E5/G5 in terms of memories, tuning methods, alarms, etc. The display is very nice with an attractive amber backlight. The buttons are tiny, but useable. COnstuction quality seems solid. The radio is fun to use. The audio sounds fine for such a small speaker. Battery life seems reasonable.

So overall, it's a nice radio, with OK performance and fun to use. But not on the par of other small radios regarding sheer receiving capabilities. It works fine for most casual listening situations. I think it is over-priced at $100. I believe Radio Shack now has it on sale for $80 now which is more in line with it's competitors.

Hope that helps.

Hi Bill. Are you calling Hams communists? For some other stations, try BBC, Radio Tiawan, Radio Australia, Radio Canada, Radio New Zealand for a few broadcasters. Then there are WWV and CHU, and many ship to shore stations, military ship, shore, and aircraft and ground stations etc...

BTW, none of these are communists, or religious broadcasters...

Do I perhaps smell a troll here?

Even if you don't use the shortwave the Degen is still an excellent AM/FM radio with the ability to pick up long range signals. I seldom use shortwave but I really like the FM performance of the Degen. It is also very handy to be able to easily carry it from room to room which I often do. I find it a pleasure to use such a good set even if I don't use all of its capabilities.

Hi, just wanted to let you know, got a tip last night about using an external wire with the g6. you can use a longer wire just don't hang it high. Keep it low to the ground. Even though I live in a second story apartment the performance with the wire is way better running along the floor. I think if something ever comes up and I find more annoyances with the g6, I'll investigate the e/g5 if I can still find one or wait for the g3. I still like the size and ergonomics of the g6 though.

Topic: 2043 Message: 2043

All this time I've been quite happily using my DE1103 - listening, testing and so on - it just finally occurred to me - it's a lot more useful with an aerial adaptor - from a 3.5mm Mono Phono Plug to a Female BNC Socket! Couldn't buy one anywhere - finished up carefully grinding down the screwed metal part of a 3.5mm Mono Plug, and slightly drilling out the cable-securing cap on the BNC Female Socket (Cable, not Chassis-Mounting) - soldered the two together. Now I can easily plug my DE1103 into any test equipment or external antenna. Now this would have been a nice item to have found in the box with the radio!

The SDR web receiver has an improved version at the same URL:
http://websdr.ewi.utwente.nl:8901/

They have added LF plus other ham bands.

News 24 December:
Our normal WebSDR, offering access to 48 kHz wide segments of the 80, 40 and 20 meter bands, has been temporarily replaced by a more advanced setup that offers a total bandwidth of 1.2 MHz, spread over 6 bands.

In contrast to the normal setup, this one does not use soundcards and quadrature mixers, but a fast analog to digital converter that digitizes the entire shortwave spectrum, followed by digital mixing and filtering in an FPGA. More information, including pictures, can be found on PA3FWM's Software Defined Radio page.

Some remarks:
This setup is temporary: in a few days, we'll go back to the old setup.
The reason for this is very simple: the board with the ADC and FPGA is my only board of this type, and I want to use it for other experiments too...
If it all works well, I do intend to build another one for the WebSDR, but that will take time and money.
If your internet connection is not very fast, you may want to activate the "almost freeze all but one" option in "waterfall settings".
The increased bandwidth makes tuning more difficult, especially on the 300 kHz wide 80m and 20m bands.
In future some kind of zoom in / zoom out facility will be needed, to utilize the even wider bands that the hardware supports (up to 1.2 MHz each).
There is no amplifier between the antenna and the A/D converter. As a consequence, the sensitivity is not good (the noise figure is about 30 dB), which may be problematic especially on 20m (where the atmosferic noise level is lower, and our antenna is not resonant and thus less efficient).

Nope. Russia stopped being Communist in 1991. Maybe if you listened to the Voice of Russia, you'd know that. Lots of religious history programs now on VoR. Back in the commie days it was called Radio Moscow.

Bill, I've followed your posts on RRS for enough years to know that you've tried maybe dozens of portables looking for one that you really liked the most.

So, why are you trolling in this group?

The DE1103/E5 radios are really very impressive. If you can't abide by that thought, if you must denigrate people with portables, or if you really believe most SW is devoid of meaningful content, I ask again: Why are you here in this group?

I think we'd love to have you in here. Your experience with multiple radios is obvious from looking your RRS posts up in the Google archive. But, we don't really need a troll.

Merry Christmas,

Mike

I'd recommend a length of miniature, flexible co-ax between the BNC
female and the 3.5mm plug to minimise strain on the antenna jack.

Hi Guys. I use an SO-239 (femail to the PL-259) to male RCA adapter aling with a female to female RCA coupler, and a sound card cable (1/8 inch stereo phone plug to 2 RCA males) to connect coax fed antennas to my KA1103 in the shack. This is a lot of adapters, but there is no strain on the antenna connector, and it works. To connect the MapTenna that I use in the bedroom, I use another sound card cable and a clip lead. The clip lead is connected to the wire lead from the antenna, and to the center of the male RCA plug that connects to the tip of the 1/8 stereo phone plug.

If you can find a BNC female to RCA male, you could use something similar to the above. I don't believe that the 1/8 inch connector used for the external antenna connection is meant to take much strain. Tom has a good point there. I have an RCA female to 1/8 male phone plug (mono) adapter that I could use with the SO239 to RCA male adapter, but thats too much weight (in my opinion) hanging on the external antenna jack.

At one point, a local dollar store was selling the sound card cables for $1.00...I should have gotten several, but I only got one to try them out. When I went back a week later, they were sold out, and I have not seen them there since.

Propagation has seemed to be better here in the Midwest U.S. since Christmas eve...hopefully we are past the poor propagation of the last few weeks!

I hope that everyone had a Merry Christmas, and wish everyone a Happy New Year!

What's scrapbooking and who's groups? I got lost somewhere.

But, also, thought I'd add some more info here about the g6 if anyone wanted. It turns out that according to Passport it is in fact made by degen. That could explain why the paging system is similar to the g5, and the fact that it too can recharge batteries if you get the rechargeables. I'm still happy with mine and have found that yeah it does overload on the wire but if the wire is lowered it helps to prevent it some.

Ok, see I kind of knew all along this was the angle you were going for. And yes you're right about the pickin's being slimmer than years ago. But in a way, for me, it's part of the challenge, especially on a portable. It makes one appreciate the hobby a bit more if you have to work at it to find something. I tried a drake r7b once and it was almost too easy. Yes stations were coming in left and right, but it wasn't as challenging. Also with a portable since I'm visually impaired I don't have to be slumped over a desk to enjoy my hobby. Another example, just the other day, I was poking around the bands trying to find something to listen too, and alas tuned Radio Canada on 11805 which I'd though had ceased SW. It was week but was there. As for the whip/external question I use a whip most of the time but sometimes an indoor wire. I live in an area where there is considerable electrical qrm (here in Austin tx) and using the whip cuts down on it some.

Hello Bill

Now that you've added some more detail to your original comment you raise a good point. Location has a lot to do with quality of reception. As you have to rely on using an indoor antenna, you may even hear more just using the whip outdoors. This would definitely be the case if you are plagued with the many different types of electronic noise we have to put up with.

I returned to shortwave after a break of about 10 years, you are right, there are fewer stations to listen to. For me, the Voice of America, BBC World Service were common. Now, they seem to be more of an exotic catch now that they are using alternative methods of distributing their programming. The same has happened with other broadcasters as well with an increased reliance on the internet or local relays.

One of the first things that I noticed was an apparent increase in the number of Chinese stations on air. A conclusion that I have reached is that it is not the number that has increased but the number of broadcasters that are not using shortwave has given the impression that the number of Chinese stations has increased. The only growth I've noticed is in the increase of religious broadcasters.

I feel that by increasing reliance on the internet and local relays, broadcasters have left themselves open to an increased possibility of political interference. The task of a government to stop information contrary to their beliefs has now been made a lot easier. All a government needs to do is to throw the switch and the information flow ceases. With shortwave, signal propagation made the task of jamming dissenting broadcasters a lot more difficult and, it was less effective because in parts of a country, some signal did get through. You can read the steps the Soviets took here http://www.okupatsioon.ee/english/mailbox/radio/radio.html

Personally, I feel the practice of abandoning shortwave for internet and local coverage is a mistake because both media are too fragile and easily interfered with. Who knows, if the world's political climate changes and broadcasters find they are not getting their message through we might see a resurgence of international broadcasting on shortwave.

At the moment, what would be compounding the apparent lack of activity on shortwave would be the lull in solar activity, we are currently in what appears to be a prolonged period of solar inactivity. You will find a lot of material here: http://www.swpc.noaa.gov/Education/index.html As you no doubt are aware, the sun plays a vital role in signal propagation.

Another thing which may be contributing to a perceived lack of activity on shortwave is improved performance of the likes of the Degen/Kaito Red Sun etc over the portables that were available 20 or so years ago when aside from specialist high priced portables, the best that we could hope for were single conversion portables with their inherent poor image rejection which meant that you could hear the same station either 910 kHz above or below the station's actual frequency. The images would have given the impression of more activity.

It wasn't so long ago that international broadcasters were calling out for more spectrum space because of over crowding. The inception of the 22 metre band (13 MHz) was the product of a prolonged effort to combat over crowding that was occurring at that time.

Your observations are correct, there has been a decrease in the number of stations using shortwave, about all we can do is to make it so we can hear what is still available better by using the best gear we can. The likes of the Degen, Red Sun are certainly a step in the right direction.

Paul

Subject: Re: [de1103] Re: Grundig G3: successor to KA-DE1103/E5/G5?

My original question was aimed at using portables for SWLing. 20 years ago a portable SWR was indeed a pleasure to use as there were hundreds of stations to listen to, easily. Now when I scan the bands with my 1103, almost nothing. I live in a town home and use only the whip antenna or an indoor wire. I hear almost nothing on SW. Even the hams are disappearing on HF. Almost nothing compared to 20 years ago. Even hams came booming in when the bands were really bad. So how was my question 'trolling'? Again I ask,

"What can you hear on shortwave with a portable?"

What do you folks listen to using only the whip antenna? Or do most of you use outdoor antennas with your portables?

WWJD? What on earth are you talking about???

Bill

Now that all the bickering and misunderstanding about the Grundig G3 has been sorted out, I have noticed several comments in regard to Redsun RP-2100 and Tecsun PL600. I have not tried either of these, as just reading the specs puts me off! I am in a country which uses 9kHz spacing, and both these radios are supposed to stop at 1620kHz when set to 9kHz spacing. Where I am, there are 6 low-power stations between 1620 and 1710kHz! Also, I notice the Redsun starts at 522kHz - 100kHz would be much nicer!
Bob VK2CAN.

Bob, you can tune the RP2100 in steps of 1 KHz. Set the switch at 10 KHz spacing, tune in "slow"mode, and you can tune all of the stations on the top end.

I have a 2100 and a DE1103. I intend to buy a PL600 and do a head to head performance test as time allows.

While the DE1103 does tune down to 100 KHz, there is so much leakage from am broadcast stations that I can only hear two or three cw beacons. I am investing in an LF converter with filters to see if that helps. Given the presence of a submarine base next door, there should be more than three Morse beacons here!

Bill, I too misunderstood your question first time around. Glad you restated it.

I've gotten back into radio these last 2 years after a 30 year absence. My how things change! But it's still fun. Just different. Certainly the radios have gotten so much neater. The 1103 is an example.

That said, I was disappointed at first hearing such little ham activity. But adding an active indoor loop changed that. Then I put up an end-fed outdoors just before snow fell. It does better than the indoor loop. And the loop does better than any whip on any portable. With the 1103 connected to the end-fed, I can almost always hear something interesting on SW or ham. Given sunspots are still at a minimum, it will get even better.

My conclusion: given low sunspot activity and reduced number of strong English signals beaming to North America, a good antenna does matter. And the hams are still active. Maybe down 30% to 40% from my last listen in 1976, but there's still plenty of QSO's going on.

Do you rely solely on the radios whip? And if there is a lot of noise around you, have you considered a loop?

I've had this Kaito for several days now and I'm receiving MW broadcast stations on several of the SW bands. 41M is the worst, I hear them all across the band, and its not just local ones either.

Has anyone else seen this?

Thought I'd ask for advice here before calling the place I bought the receiver from.

Hello everybody
The most important question (for me)....Grundig G3 has or is going to
have RDS?
Thanks and happy new year at all!!!!
Sorry for my english.....

Hi

I notice something similar with some of the locals especially those that are on the top end of the MW band. It is possible that some if not all the signals you are picking up are harmonics of the MW station. You can do a quick check http://allenk.home.infionline.net/harmonic.html 3186 kHz is an example being the second harmonic of one of the locals. I find though that if I connect an external antenna the harmonics disappear.

Perhaps this is happening with you too.

Paul

I have the same problem with my 1103, even with an external antenna. My
next plan is to use an antenna tuner and see if that helps.

The harmonics and intermod products are generated internally due to overload of the RF preamp (in the case of the whip) and/or the mixer (in the case of the external antenna on older models which bypass the preamp when the antenna jack is plugged). An antenna tuner MAY help but a preselector would be better. This depends on the configuration of the tuner - a pi-network acts as a low pass filter so the MW signals will go right through. A T-network tuner with an L in the vertical branch would be better as it acts as a high-pass filter and can suppress MW signals. In prior messages, I described converting a MFJ-956 T-match to a very effective preselector which outperforms the tuner in suppressing off-frequency gangbusters.

I'm using the G5, and I'm amazed at all I pick up using only the telescoping antenna. There's no question that the pickings are much slimmer than years ago, but between changing technologies and the sunspot minimum I'm surprised I hear anything. Along with a decent number of foreign broadcast stations, 75-80 meters seems continually active throughout the day, with QSO's and nets going on at all hours of the day and night. There's quite a bit of activity on 160m at night that I can hear, which is surprising since that band is picked up on the internal ferrite antenna, and the gain is significantly lower than everything above 3MHZ.

Activity on the 75-80M band on weekends can be so busy that the problem comes from overlapping QSO's rather than a lack of something to listen to. I hear Hams up and down the east coast and out to the Midwest. International skip on 40M seemed to die with the end of summer.

This example of the fallacy of using a means of other than shortwave was sent to Hard Core DX. (Credit to the original poster). It will be interesting to see if the broadcasters involved substitute these relays with shortwave.

Azerbaijan restricts foreign radio broadcasts
Published: Tuesday 30 December 2008 21:25 UTC
Last updated: Wednesday 31 December 2008 16:01 UTC
The government of Azerbaijan has terminated broadcast licences issued to foreign radio stations. As of 1 January, numerous broadcasters, including the BBC, Voice of America and Radio Free Europe, will no longer be allowed to broadcast on national frequencies.

Europe and the United States have severely criticised the decision and accused Azerbaijan of restricting press freedom. Baku says the new regulations are not politically motivated and points out that foreign radio stations will still be allowed to broadcast via cable and internet.

According to the photo, yes!
http://universal-radio.com/catalog/portable/4033lrg.jpg

See the lables "RDS" and "RDS Mode" underneath the two buttons near the bottom right. They suggest that the functions of those buttons changes when the radio is set to the FM broadcast band to provide control over the RDS display rather than the product detector. Presumably, the frequency and/or time display will be replaced by RDS fields.

Dear Tom:

What message was that? I could not find the MFJ-956 mentioned in any
earlier posts.

Can you recommend a good book on receiver antenna design, preselectors
and tuners? For that matter, what is the difference between an antenna
tuner and a preselector?

Thanks!

That will need to wait a while. I've got a plate full of commitments before I get to the fun stuff in February. I plan a head to head test of the RP2100, DE1103, PL600, using whips and at least three different external antennas.

Gong hi fa choy!

Sorry, Gordon, got my model numbers mixed up. It was the MFJ-901B and
the message #1966 http://groups.yahoo.com/group/de1103/message/1966 .

The purpose of an antenna tuner is to transform an impedance of a
load to match the impednace of the transmission line so that the
Voltage Standing Wave Ratio on the transmission line is close to
unity, i.e., ideally there is no energy reflected back from the load
to the transmitter due to an impednace mismatch. This can be
accomplished in a variety of ways - hence there are tuners based on
Pi, Tee, L and Z matching networks and on transformers and
autotransformers. There will be incidental filtering effects that
differ among the various matching networks but filtering is not their
primary goal. Antenna tuners are primarily for transmitters so that
high VSWR does not cause voltage breakdown in the transmitter output
stage or in the transmission line, to keep transmission line losses
low and to maximise the power delivered to the radiator. These are of
little consequence to LF/MF/HF radio reception but are of greater

significance to VHF and higher reception and the wider bandwidth modes on these bands.

The purpose of a preselector is to allow only a selected range of frequencies to pass from the transmission line to the receiver input. Better receivers have an integrated preselector that is automaticaly or manually tuned. Its primary purpose is filtering, not impedance transformation although that may be integrated (e.g. a transformer whose higher impedance secondary is resonated by a capacitor as in the RS DX-394). Typical outboard preselectors will have either a series resonant LC network in series with transmission line or a parallel resonant LC network across the transmission line.

Check your local library for books by Joe Carr and by ARRL, particularly the ARRL Antenna Manual and the ARRL Handbook for Radio Communications. You will find numerous examples in the Shortwave-SWL-Antenna group http://groups.yahoo.com/group/Shortwave-SWL-Antenna/ . Bob Betts is a member of this and a preselector guru - see his site http://www.bobsamerica.com/swl .

Dear Tom:

Wow. Thanks for such a concise explanation. However, if you are in a weak signal area, don't you want as much of the desired signal as possible to reach the detector, making impedance matching of antenna and receiver circuitry important?

The Bob Betts website is awe inspiring. If he can transform a Super Radio III into that amazing monster receiver, I wonder what sort of evil things he could do with an R390?

Tnx

What you want is for the atmospheric+galactic+local manmade noise picked up by the antenna to be just strong enough to swamp the receiver's own noise. A weak signal is only going to be audible/detectable if the ratio of its received power to the received noise power is above a threshold that depends on the type of signal. Collecting more of both the signal and noise with a bigger antenna won't change the ratio (ignoring the effect of changes in antenna pattern) and won't make the signal any more audible/detectable. In fact, collecting too much energy will overload a radio, generate internal interference and make the signal less audible/detectable. That's why the preselector helps - reducing the energy delivered to the first active stage from spectrum away from the desired signal.

It does not take a lot of antenna to meet either criteria so matching is not very important. Indeed the DE1103 overloads on its whip. If when you disconnect an antenna you do not notice a sizable change in the noise output from the radio when tuned away from stations, then matching may help, a better antenna will help, a preamplifier will help, or your radio needs to be fixed.

2074. Synchronous Detectors

Yahoo group: de1103
Date: 2009-01-05 21:22:55 UTC
From: bobyorston
Topic: 2074 Message: 2074

Has anyone any thoughts in regard to modifying the DE1103? The TA2057N seems to be used in it's normal (envelope detection) mode. Anyone got a suitable mod, or does one buy what sort of radio?
Bob, VK2CAN.

-Just one further thought - if one pulled pin 2 of the TA2057N
permanently high, then pin 18, now the IF output, rather than detected
output, could be used to feed any synchronous detector chip.
Bob, VK2CAN.

Wait for the Grundig G3 or equivalent in Eton, Degen or other guise. It
probably shares a lot with the 1103.

Can the TA2057N be used as a synchronous detector? It's not evident in
the data sheet. I think the 1103 takes the IF output from the TA2057N
to go to its product detector, IC7 on the schematic (no p/n).
Otherwise, the TA2057N is the AM/FM demodulator.

As you can see, I have uploaded a file of the procedure to install
static protection diodes to the DE/KA1193 radios. It is a PDf file with
instructions a picture and a diagram.

Hi Mark. Thanks. Some folks in the E5G5 group were asking for more info on how to install the protections diodes. Just something I threw together in about an hour or so. If it can help a few people avoid the blown preamp FET problem, it is well worst my modest efforts. Replacing the preamp FET is not a job for beginners nor the inexperienced.

From: oldbrand_7
Topic: 2084 Message: 2084

hi! got a de1103 since few days..

i can't use it near my lcd monitor, cos i have a sound like THX advice in cinemas!

then even if i'm far from pc i can't hear almost nothing..no Mossad on 4270 or other freqs, few broadcasts, i just listen OMs in 7000-7100 or 3500-3800 (in italy), hardly and bad.

i tried place the ext.antenna in my terrace but it's worse! great static noise on all band, hardly got something, the telescopic antenna is better.

i haven't tried the radio outside my house yet, but these problems are very annoying!

i tried to switch off everything in my room...and nothing changes.

a friend told me to use a coaxial to connect a "real" external antenna, cos the bundle im using cross the wall to go outside.

i read houdred post in newsgroups forums eham etc.etc. and noone said anything abut these issues..

im waiting a icom R1500 (and a discone ant.), uniden bc72xltD and radioshack pro-90 cos i like v/uhf. i'd like hf too, but this way is a mess.

Hi

Noise from a PC can travel quite a long way, the best thing you can do is to shut the PC down completely which includes disconnecting it from the mains. The monitor is only half of the noise source, the processor is another.

While on the subject of noise, video tape recorders can be a source, a satellite or cable TV set top box and the TV itself or light dimmers especially if you have any touch sensitive bedside lamps are other sources also a broadband modem.

One thing you can do is to go around your residence with the radio and see how many noise sources you can identify.

Sure you can make things some what better by using an outside antenna with screened cables and an earth, but the most effective solution is to pull the plug all noise sources.

Paul

Dear OM; Sounds bad. Sorry to hear. Paul is correct to look for noise source - but first, why not take your radio outside and around your yard and block? Noise may come from electrical transformers down the street, from your PC, from your TV - who knows? Noise is very bad these days and now you must track down the source(s) of noise.

Best regards,

Mark in noisy Milwaukee

Hi. As Paul and Mark have told you, a lot of home electronics cause noise in the shortwave radio spectrum. Some of the plug in power supplies to various things can be bad for this too, as many these days are switching supplies, which can generate a LOT of noise. You also may get noise from other people's home electronics.

It sounds like the problem is not the radio, but the noisy environment you live in. I hope you can track down and eliminate the noise!
I had to get a bunch of snap-on ferrite chokes here. I have several on the CAT5 cable that goes from my router to my cable modem. I also had to replace the very noisy switching power supply to my router with a non-switching one. LCD monitors themselves do not usually radiate noise, but poor quality cables from the computer to the monitor (or other devices) might be a problem.

You might try going to a park, or someplace away from power lines and houses and see if that helps. I hope that we have given you a few ideas to try.

Good luck

thank you all guys!

i turned off everything, but the problem is still here.. it seems attenuation, if i go in terrace the radio works better, but we're in winter!! :-)

rome is not so cold but i'd like to use it in my room!

i'll try a coaxial and put a little dipole outside, cos the long wire that comes with the degen gets too noise, perhaps cause it starts from my room..

before i'll try simply to use it outside with or without the long wire..but really i'm thinking to sell it, cos soon i'll get a icom R1500. if i'd like to have a little handheld radio i'll buy the new grundig G3, cos i like more the keypad layout, and the lsb/usb button instead of the fine jog! it's hard to use that jog!

ciao!

Good to hear. My SWL got better after I put 75 ft end-fed long wire outside. I use 9:1 balun and feed with coax. No more noise from inside but still noise from outside power lines. Yet much better SWL.

I am waiting for G3 also.

Good luck!

Mark

I have tried to use those bulbs, but they give two of my friends headaches after 20 or so minutes. The bulbs given away here have a slightly yellow and pink tinge, so I can't have any of the bulbs on when I am working with colors on photo projects.

I have seen plans for converting these bulbs to shortwave radios. Maybe that is the silver lining here?

Hello-

FWIW, I use these bulbs at my house with recessed lighting and some smaller lamps. I can't tell any difference in noise when they are on or off. Other noise sources in my house are much more offensive.

I don't think the bulbs I bought are too fancy. I remember them being the cheapest when I bought them over a year ago. I think they start making more noise as they age, especially if defective from the get-go.

For those in the US who might be interested, I bought mine at the Home Depot. They were cheap--I can't remember the brand but they came in green and white packaging, and come in the soft-white variety. I find them similar to regular bulbs in color of light, though they are more yellowed. A secondary advantage of this kind is that they are covered by a (rubber? plastic?) shell that I imagine makes them safer w/r/t mercury.

Regards,
-Claudio

Wait, we can hold out hope that LED household lighting will be viable by then. Of course that may generate birdies in our digital receivers with all those diodes blazing away.

I have tried to use those bulbs, but they give two of my friends headaches after 20 or so minutes. The bulbs given away here have a slightly yellow and pink tinge, so I can't have any of the bulbs on when I am working with colors on photo projects.

I have seen plans for converting these bulbs to shortwave radios. Maybe that is the silver lining here?

LED I doubt it, aren't they supposed to be last forever? If so, there won't be much demand after everyone gets them.

Seriously though, noise is a very big problem, it certainly is at my QTH which is a block of four flats. Items that I have determined that cause a lot of noise are:

TV set top boxes (and the TV itself)
Digital displays in stereos
Some VCRs
Computer (Processor, Monitor and broadband modem)
Touch sensitive bedside lamps

In areas that have broadband internet via the mains, this is also a major source of noise.

Sadly, gone are the days that all we had to contend with was interference from the family TV.

Re: [de1103] Re: i can't hear almost nothing!Hi Gordon

So have I, I managed to last about half an hour. There are supposed to be 'soft tone' (whatever that means) bulbs but all I've found a low wattage ones. I need the equivalent of a 150 watt which don't seem to be as readily available.

it's not a rfi issue, or better, that's not the serious problem.

in my terrace i hear well almost everything with telescopic antenna.

going inside, near the external wall the sound goes down, and inside i don't hear nothing.(im on 3rd floor, reinforced concrete..or red bricks.. we don't have wood houses in italy! neither near the sea or outside big towns).

in my room i listen just broadcasts, if i go near the window i get om bands on 7000-7100 and few more, like air traffic control from north africa..but there's a lot of static noise. then near the monitor it simply sucks.

i could use it only outside home, you understand it's almost useless this way. and long wire antenna gets lots rfi, it's worse as i said.

so i'll sell it, take a icom r1500 with discone, and if i need put a t2fd cos im on 3rd floor but i have a little piece of earth downstreet where are my dogs and cars, and i think nobody worries if i put some wires from here to there :-)

ciao!

Hi. Sounds like the building walls are blocking the signals. This happens in some concrete/brick/stucko structures. An outside antenn fed with coax should help get better signals and reduce the RFI.

I used a 40 foot wire connected to the center lead of some coax, with the outside conductor (the shield) grounded to a ground rod. It worked pretty well. The Degen DE1103 and Kaito KA1103 are good portable shortwave receivers, but they will not work as well as more expensive tabletop radios.

Good Luck.

yes, surely it is so.

a friend told me to make a coaxial and plug a wire totally outside, but even if i'd fix i don't like keyboard layout and the ssb jog. then scanning restarts at the end of every band, and the step is too wide in ssb. then if you insert a frequency you have to push again ssb button... it's too complicated.. i'd like a faster system, and i'll take a icom R1500 which lets me enjoy in/outside, in bed, in car...

so.. i leave the group.. perhaps in a future i'll get the Grundig G3 and i'll be back 8).

lol.. in italy we use cul8r too on forums etc. but in italian 8 is pronunced "otto". and "culo rotto" means broken ass :-)

so if you write wrong.. it's culor8 :p

Hi Eric - Yes, it does run without batteries, but why bother? (I assume they all come with Ni-Cads) - a portable is limited if it has a mains lead and plug-pack attached to it - you could even say it's not portable!
Regards,
Bob, VK2CAN.

2104. Improving the Degen DE 31 Active Loop

Yahoo group: de1103
Date: 2009-01-31 14:50:22 UTC
From: Ian
Topic: 2104 Message: 2104

Hi All,
Having recently purchased a DE 31, I was a little disappinted that it didn't tune up on the 80 Metre Ham band.
I have now extended it by 32" (80cm) and it tunes up really well on 80!
It has a nice sharp peak from 3.5 MHz up to 14.5 MHz. On MW, it peaks from 500 KHz up to 2 MHz. This makes this little loop more useful to me as I spend many hours listening to 80 Metres.

The loop wire consists of two multistranded conductors which are enameled and shorted together at both ends. My junk box produced a length of similar wire which is just as flexible and nice and light. I decided to extend both ends of the loop to give it a more symmetrical appearance. The loop was unoldered from the small PCB and the new pieces added. A small length of heatshring tubing was employed to tidy the joints. You will need to mve the knots, in the loop wire, down a few inches to give you a symmetrical diamond shape to your loop.

Because the loop is bigger than before, it also works better on medium wave.

Try doing this modification to yours! You could replace all of the loop wire, it's up to you.

73,
Ian G1DRP

It's a cool looking radio, Rick. I like the simulated S meter. I found more photos of it here:

http://viru.livejournal.com/87410.html
<http://viru.livejournal.com/87410.html>

and here: http://www.5bcl.com/Article/Class25/200811/2885.html
<http://www.5bcl.com/Article/Class25/200811/2885.html>

Is this the Chinese version of the Grundig G3? It seems to have significant differences in the display. I'm guessing the "Fast" on the display indicates a fast/slow tuning option?

The livejournal website has specifications on the left that show a spectrum hole between 1620 and 1711 kHz. Not sure if this is an oversight, but this would not be good for mediumwave X-banders.

Hi Diana. The REC output is stereo. It is a line level output for connecting the radio to a stereo amp, receiver, or computer sound card (line in). You would connect an external speaker to the headphone jack. You could connect amplified computer speakers toi the REC output.

Have purchased from tqchina last month one of these and must say it's a battery pig and the audio quality is not comparable with the 3 sony receivers I have collected over the years (7600, 2010 and 77). Without researching the archive I can't say whether audio quality is an issue, maybe this example is a bit off. Otherwise for sw listening it's no slouch and will get occasional use. Am looking forward to taking it and the 2010 into NSW countryside away from QRM to compare the two next weekend. regards ken

I have had a Degen DE1103 for about a year and have been pleased with its performance.
I thought the sound quality was good for a small radio. Have been using it for CW practice, listening to W1AW (the ARRL station). They send slow code twice a day on various bands.

Anjan DTS-380. High End Portable.
If anyone has tried it out, please post your impressions here.
Perhaps an alternative to the DE1103?

I've had my Degen 1103 for 4 years (Mar '05) purchased through <lipyn>
on eBay, and wouldn't describe it in any way as a "battery pig".

Them's the breaks, I guess.

Audio-wise, well, it is a small hand-held. But I use it with
headphones anyway.

Um, my purchase price was $US45... so let's be a little forgiving if
ALL the features don't measure up.

Reception-wise, it gives my Eton E1 a run for its money... just
doesn't have the bells and whistles that $500 pays for.

Perhaps the OP is experiencing battery-capacity or charger issues? From what I've seen here, a number of folks have found the factory-supplied batteries and/or chargers lacking in capacity...

Hi !
I second that.
I've mine for a week now. The supplied batteries won't last a day. So
I fully charged them into the radio, then measured out each voltage.
One did not get charged at all. So the set ran only for a few minutes.
I charged them individually into my NiMH battery charger and the set
ran for 4 days...
I wonder if the charging circuitry is good enough for the NiMH process
? (having 4 batteries in series during charge does not seem a good
idea to me)

They do seem rather variable. The audio quality on my three-year old model is very good, and the battteries are still working OK (I use an external charger).

Thanks for the info gentlemen. The one I had last year did well with the supplied batteries (4 days normal) and no other issues as I recall.

I should be getting mine next week. I will charge the supplied batteries in an external wall charger, I suspect the internal charger is designed for travelers who normally don't carry a wall external pod type charger.

There should be a "Sticky" in this group concerning the batteries that come with this radio. Step 1. Throw out the batteries that are supplied with the 1103.
Step 2. Buy replacement batteries.
Step 3. Always charge the replacement batteries is a dedicated charger, NOT the radio.
Step 4. Enjoy long battery life and a super performing little radio.
Or: If you want grief, short battery life and and hot radio, ignore the above 4 steps.

Hi Ken. I will have to take exception to number 3. If you have good NiMH batteries, there should be no problem with charging the batteries in the radio. I have done so with both my KA-1103, and my Grundig G5, and zero problems so far. Both radios will operate for up to 28 hours on a fully charged set of batteries(your millage may vary). This is consistent with the current drain that I have neasured on both radios of aproximatley 75 MA at a volume setting of 14 on the KA-1103, and 7 on the G5. I use Kodak pre-charged 2100Mah NiMH batteries. I get the same run times whether I charge the batteries in the radio, or in an external charger.

Number 2 needs to be amended to read "Buy good quality replacement batteries". I have found that Digital Concepts batteries have poor quality control. It is not unusual to get one marginal battery out of a set of 4. And neither the NiMH batteries, nor either of my radios get more than very slightly warm when charging the batteries in the radio. If yours gets hot, there is a problem with the batteries or the charging circuit in the radio.

The batteries Kaito supplies with their radios are obviously cheaply made. The fully charged voltage on my set of 4 ranged from 1.42 to 1.23 The Kodak batteries read a uniform 1.44 volts when fully charged. I have marked each set of NiMH batteries, and keep sets together.

From: dutchie5959
Topic: 2129 Message: 2129

Hi there,

Good to see a dedicated Group for this little unit.

Where do I start.....??
I have not been involved in radios for over 30 years.....I purchased my 1103 some 15 months ago but it has not been used as I contracted the dreaded MSRA (Superbugs)....and now after 15 months, and back home, I want to begin using it again.

I set it up last night and used the additional 31MS Loop antenna which goes outside and attaches to my Colourbond shed some 10 meters from my unit.

I got great reception last night picking up foreign languages and other asain based signals.
I'm based in Melbourne Australia.

My question, I did not pickup really outside Australia and the rim of outer Asia.

The question I have is how (if possible) would I be able to pick up U.S, Middle East and Europe (Netherlands in particular)?

How can I get a bigger range....I assume with a better antenna setup??

If so, how and with what.....please keep in mind that i regard myself as a total newbie after all these years.....

thanks heaps

Greetings Dutchie;

From one old SWL who has returned after 30 years to another, welcome back. I am sure you will find the SWL bug more pleasant than the MSRA bug.

To answer your questions ... sunspot activity is at an all-time low and has been staying at this low for longer than historically usual. This means for an extended period of time SW propagation has been at its' worse. EX: I should be able to listen to ABC in the wee hours up until 8am local time on 9580 and a weaker version on 9590 anytime I want. Sometimes however the signal is just not there. 15 mhz and up is pretty much dead except for a couple hours midday.
So propagation is down from what you probably experienced as a lad "back in the day". The other big change is English is a dying language on SW. Actually, seems all languages except Spanish are dying languages on SW. I find the 1103/31 loop is a great combination and thank goodness because nowadays Radio Netherlands & BBC only xcast English to Africa so I've got to grab broadcasts not intended to be heard here in North America.

The 1103 hears more now that I put up an end-fed sloper (75 foot long wire with a 9:1 un-un at the termination end). To extend your range, I'd suggest a long wire like I have or if you want to spend a few bucks, you can get a trapped dipole (tuned for SW bands) or spend twice as much as you did for your radio and go for the Wellbrook 1530 loop. Pricey but seems to satisfy most.

Happy listening,

Mark

From: dutchie5959
Topic: 2131 Message: 2131

I am contemplating extending this with wire and seeking advice.

Currently, it runs from my window along the house brickwork and is fixed to my metal shed.
Is it worth extending it longer by say another 20M and run it along the top of my fence twisting it to the original clips supplied and if so, should this be any improvement in reception etc etc.....

I am a total newbie.....from Melbourne, Australia.....

cheers in advance

I wouldn't go lower than 16 gauge stranded. Stranded is easier to work with. If your extension is clear of obstructions use bare or insulated, it doesn't matter.

Some years ago, Arthur C. Clarke proposed a rule for machines in his novel, "The City and The Stars"--

'No truly efficient machine has any moving parts."

Maybe the next step in electronic designs should be a sensor that follows the movement of the hand around a non-moving virtual knob, translating motions into up/down etc. equivalencies to change frequencies, or any other desired characteristic.

Thanks for the link, Ken. I knew about this source and have been
dithering over ordering one because it seems to be the same as the
original part and liable to go flaky after a similar period of use.
Maybe it's better to get a new radio - that Grundig/Eton G3/E3 maybe...

Hi !
I've to say that the Degen batteries benefit from a few cycles. I've
let the radio run until total drainage of the batteries, recharged
them and they last longer now.
At first, using the radio as the charger, one battery was less charged
than the other 3. but now, it seems the 4 of them get an even charge.
so you may want to cycle them a few times to get good performance.
I have a set of 2100 mAh I only charge in a good wall charger so I can
let the Degen original one die if they have too, but I've found them
to be better (in the 1300 mAh limit they have, of course) than they
where when I get the radio.
Hope this helps.

I think the tuning control is just a rotary step switch, and when the grease inside them gets old and thick it interferes with electrical contact. If it can be opened, I would strip out the old grease and repack with light Teflon grease. I've had to do this on stereo volume controls and the like.

I think I've seen replacement controls on eBay, in case it can't be opened.

Nelson

FWIW...

The grease replacement works if the knob jogs inconsistently. Let me explain.

The jog dial that I replaced (close ups found in the pictures section) would reverse direction when the jog dial was at a specific location. It would act normal until the knob rotated another ~360 degrees. When I opened up the encoder, one of the contacts were damaged causing an intermittent open. The jog dial needed to be replaced. I do not imagine that this happens often. It may happen often with the Degen/Kaito encoder for whatever reason.

If a jog dial jumps around with the wheel at different locations, there is likely debris in the grease that is causing the intermittent opens. As the knob turns, the debris is moved around so the intermittency changes relative to the knob angular position. It should happen more often. Removing the grease removes the debris. Don't leave the encoder without grease because then it will oxidize and/or get dirtier faster than before (friction).

Thad

From: Nelson <greenbrier614@...>

I think the tuning control is just a rotary step switch, and when the grease inside them gets old and thick it interferes with electrical contact. If it can be opened, I would strip out the old grease and repack with light Teflon grease. I've had to do this on stereo volume controls and the like.

I think I've seen replacement controls on eBay, in case it can't be opened.

I knew something was going
wrong with the radio, the
4th digit in the display was
showing half the segments.
Reception on ssb was at times
not stable. The ssb problem started
about 10 months ago.

The display wouldnt show an 8
or a 3, like the left hand side
went blank. No mhz was displayed
either when in fm mode.

Oh well, radio worked so well for
3 years I ordered another one
tonight. $25/year for reception
isnt bad.

Just thought I give you a heads
up when they start going south and
what to look for. At least thats
what happened to me.

RIP my first Degen 1103.....

TQchina send me a good one.....

From: John
Topic: 2143 Message: 2143

Good info, Thanks.Maybe a spare encoder would be prudent.

My 1103 arrived yesterday and is waiting at the local PO till Monday, so I'm looking forward to getting it. For an inexpensive radio I guess 3 years is a good record depending on usage. I had a Sony 2001 for many years of business travel around the world and it lasted aboout 20 years fo the price I paid it was worth it. Chinese portables have not yet achived a QC ratings like some Japan manufacturers and US.

As most know even Sony now offers no service for the 2010, SW-55 and 77 and limited parts are only available from overses.

According to ebay listing tqchina, the de1103's
now come with alps encoder, quad gang variable
capacitor,sound distortion fixed, fm sensitivity
improved and protection diodes added.

I never had any problems with my encoder.
It was the chip (brain) that went bad.
Saving the RIP Degen for parts. My RIP
Degen lived the quiet life, no drops, no
damage etc. It just went.....

Topic: 2145 Message: 2145

My 1103 arrived last Monday and so far excellent results here in Idaho, I am in the foothills of Boise Idaho about 2800 ft and the radio on the internal whip at night 2100-2200 hrs before bedtime, so far outpreforms my previous Somy 7600GR. No CD with this one just the wire antenna, batteries, charger, pouch and booklet along with earbuds. For the money and features a great buy.

Unkown if this one has ant diode protection or ALPS endoer, like the ones offered by TQCHINA on ebay, he was my last seller a year ago.

any way of checking by opening?

2146. Grundig G4 at woot.com, one day only, $100

From: wgmartin999
Topic: 2146 Message: 2146

The website woot.com is a closeout merchandiser that sells items for one day only until they run out. You can buy one, two, or three of what is for sale that day. Shipping is a flat $5, no matter what you buy.

Today, March 13, they have the Grundig G4 for $100. That's the one with the built-in MP3 player/recorder.

First time I've seen them have an SW radio. I have no connection with them other than having bought different items from them at multiple times. Thought people on this group would like to know.

Still having problems setting up presets after resetting. I have 2 presets programed_00 01. When I try to store the 3rd station by pressing store, then turning jog dial to get to next available empty slot 02, all that comes on screen is the already programmed 00 and 01 frequencies, not 03. Just as happens when I push the M/F button and turn the jog dial. I must be reading the instructions wrong. It would seem that I could store new frequency in next empty slot 02 which never appears. Any help will be appreciated.

Hi. Here is how to set the preset memories. First get thr frequency that you want in VFO mode (not memory mode). Press and hold the store button, and rotate the jog dial to select the memory you want. Then release the store button and press it again. If this doesn't work for you, try reset a couple of times. If the above procedure still doesn't work, then you have a defective radio.

The flimsy wire antenna that comes with the radio is fine, until stepped on late at night.

I bought a Combi-tenna, which is a big improvement over the stock whip. My whip antenna broke after a year of use, so buy a spare if having one is important.

With an amplified or wire antenna, reception is phenomenal compared to any other $50.00 radio. The RP2100 can be a bit more sensitive, though harder to tune without a keypad.

Hi Gordon,

The Combo-tenna <http://hamradiofun.com/combotenna.htm> you mention seems like a really simple circuit with only a few components on a veroboard (I'm assuming just a single transistor acting as a broadband amplifier).
Can you read the transistor part number for me from your combo-tenna?

BTW I have never been able to work out why people call the telescopic antenna a whip antenna <http://en.wikipedia.org/wiki/Whip_antenna> .
They are two different things.

regards
Peter

2165. Using the Degen 1103 above 29.999 Mhz

Yahoo group: de1103
Date: 2009-04-26 22:59:46 UTC
From: nilsson_6
Topic: 2165 Message: 2165

I'm an electronics tech, but I can't build something like this beautiful DE1103 for less than I bought it, and it is a great performer. After reading the various "tricks" for reception past 29.999 Mhz, I did some testing, and here's a better explanation for what's going on, and some test results.

Degen DE1103 30.000 to 39.000 Mhz

Use the "Tune below 100 kHz" trick and a stopwatch. Each group of 10.000 Mhz takes about 7 min 00 seconds to scan down if you switch the Local/DX = Lo Dx switch to Lo, and retract the antenna and clip in place. The first character of each 10.000 Mhz group will vary, and even if it's a number, will not usually mean what it displays.

The first odd character displayed is like "a". or a numeric "8" without the upper left segment; we'll call it "a"
The second odd character displayed is a small square with a bar over it; we'll call it "+"

As one scans downward from 0 kHz, here's the elapsed time, displayed frequency, and actual frequency :

Time (min:sec) Display Actual
0:10 a9xxx 19xxx kHz
6:50 a0xxx 10xxx kHz

7:05 a9xxx 09xxx kHz
13:50 a0xxx 00xxx kHz

14:05 a9xxx 39xxx kHz
21:05 +9xxx 29xxx kHz
28:05 +9xxx 19xxx kHz
35:05 19xxx 09xxx kHz
42:05 a9xxx 39xxx kHz
49:05 29xxx 29xxx kHz
56:05 19xxx 19xxx kHz This last one then
enters a pre-defined band and just scans within that band.

So you can use the frequencies in either the 14 elapsed minutes or 42 elapsed minutes groups to set up predefined stored memories; I've stored 30.00 to 39.00 Mhz as Mem 30 to mem 39.

In the schematics filed on this group, there's a filter installed in the electronics to start filtering out frequencies above 30 Mhz, so one will find decreasing sensitivity going from 30 MHz 39 MHz. I set up a very low power AM transmitter running at a fixed strength, variable frequencies, to show the effect of this filter, as signal strength bars vs frequency:

Frequency bars of signal strength

26500 kHz 6
27500 kHz 6
28500 kHz 6
29500 kHz 9
30500 kHz 4
31500 kHz 4
32500 kHz 4
33500 kHz 9
34500 kHz 5
35500 kHz 2
36500 kHz 2
37500 kHz none
38500 kHz none
39500 kHz none

In most designs, each bar means 10 times the power of the last bar displayed to the left, so if you have a 1 bar signal, and a 3 bar signal, the 3 bar signal is 100 times stronger than the 1 bar signal. This means that the useful range of this "trick" is from 30 Mhz to 36.5 MHz, but strong local signals will be picked up right to 39.999 Mhz.

Enjoy!

Great discovery nilsson.

If I adjust the two filters [1] so their upper corner frequencies are around 50MHz rather than 30MHz will the DE1103 be able to tune to 50MHz, or does it not go above 39.000MHz ?

regards
Peter

[1] Existing filter specs in the signal path from the telescopic antenna to MIXER 1:
BPF with Fc_lower=1.7MHz and Fc_upper=30MHz
LPF with Fc=30Mhz

Not my discovery, but I found the discussion on a Russian website far too long and on the wrong trail.

The Degen DE1103 never tunes above 39.999 MHz; those other blocks in the post are just aliases for normal reception blocks of 10 MHz. That's why high signal strengths show up on them, but not on the two 30.000 to 39.999 MHz blocks.

I'll post later about how to improve 30-39 MHz reception without opening up the receiver.

Subject: [de1103] Re: Using the Degen 1103 above 29.999 Mhz

Great discovery nilsson.

If I adjust the two filters [1] so their upper corner frequencies are around 50MHz rather than 30MHz will the DE1103 be able to tune to 50MHz, or does it not go above 39.000MHz ?

regards
Peter

[1] Existing filter specs in the signal path from the telescopic antenna to MIXER 1:
BPF with Fc_lower=1.7MHz and Fc_upper=30MHz
LPF with Fc=30Mhz

Dear Peter:

Having just moved house, I am looking for most of my electronics at this point. The amplified antenna uses an FET, and I'll post details as I find it in the boxes of assorted small electronics.

The telescoping antenna is called a whip antenna, at least in the Midwest, because the were commonly used as inner city street weapons c. 1950. Breaking one off of a car it becomes a stinging, very damaging weapon, quite similar to aã□□steel whip. Or at least that's what I've seen and been told.

73,

Gordon

The Degen 1103 doesn't receive the aircraft frequencies, just shortwave below 40 MHz and the standard FM band in Japan/North America.

The manufacturer of the Degen brand, Tecsun, does make aircraft band receivers that are a little like the Degen 1103, under the brand names Eton and Grundig, and might have something under the Degen brand as well. Check on eBay in the same eBay stores that sell the Degen 1103.

2178. Dead Radio

Yahoo group: de1103
Date: 2009-05-14 00:10:12 UTC
From: Jonathan L. Poland
Topic: 2178 Message: 2178

I am curious what everyone thinks about my situation. I'm sorry if I ask too many questions in a single email...

I bought a DE1103 about five weeks ago. About a week after getting it I lost all AM - soft static nothing else, even on strong local AM stations. I assumed that I had blown the FET front end, so I replaced the FET according to the instructions on this list. I am very experienced w/ soldering and I am confident I made the change correctly. However this did not fix the problem.

While I had the board loose of the case, I was going to add limiting diodes to the front end. However when I got the board free, I discovered that it already had diodes in place.

The radio is all buttoned down again, but IIRC there was an etched label on the board stating that it was version 3.

In addition to all this, I was surprised to see the poor condition of the back of the board. There is some kind of residue all over the back - more than just flux - almost a salt crust, like this had been dropped in the ocean.

1. Has anyone seen anything like this before?
2. Is my radio hopeless or should I be looking for zapped components downstream of the front end FET?
3. Did I really get a brand new radio, or is this a refurbished one?
4. Has anyone tried to get warranty service on this radio and were you successful?

Thanks!

jon

Jon; Tough situation. Did you buy a Degen from China? Which vendor? Tquchina, from my experience, is a fair seller who will not leave you stranded with a dead unit. But there are additional transportation costs. Have you contacted your vendor?

And I also understand the desire to fix-it-yourself. But if you broke open the case, did you void whatever warranty might have been offered? As for the crust, I've never seen a circuit board covered with white stuff. Doesn't sound right. I have not cracked open my DE1103 as of yet although I know through comparison testing my whip FET is blown. But I also know this FET is only for frequencies above 2000 or 2500 (can't recall where the cutoff from ferrite to whip is). IE, sorry but the ferrite for AM does not rely on the surface-mount FET you replaced.

Is the crust water soluble? If is it salt, salt will retain moisture. Perhaps it has caused component failure or preferably, circuit imbalance. Have you tried rinsing the crust away? (if so, let the radio dry for 24 hrs b4 powerering up again).

On a less radical note, have you tried the reset? Mine has died a few times while changing batteries and the 'reset' fixed the problem.

Good luck,

Mark

Concerning the "salt crust", even though I never made such operation it seems logical to try to rinse it and let it dry thoroughly before use. Just to be safe I would use distilled or deionized water for this operation, as tap water has some salt content, low but not negligible if there is a conductivity issue. My only doubt is if some component may not be watertight and be damaged even by distilled water.

Just my two cents

Hi Lino,

You should be able to listen to MWARA HF air communications in SSB mode. I listen to airline flights traversing the Pacific ocean in San Diego with the supplied wire antenna on my Degen. These frequencies should work for you (depending on the time of day):

(SAM - SE) South American South Eastern Area
frequencies
3479.0 - 5526.0 - 8855.0 - 10096.0 - 13297.0 - 17907.0
Ground stations
Asuncion, Belem, Brasilia, Buenos Aires, Campo Grande, La Paz, Montevideo, Lima, Porto Alegre, Port Velho, Recife, Salvador, Santa Cruz

(SAT - 1) South Atlantic Area 1
frequencies
3452.0 - 6535.0 - 8861.0 - 13357.0 - 17955.0
Ground stations
Brasilia, Canarias, Cayenne, Dakar, Manaus, Paramaribo, Recife, Rio de Janerio, Sal Island

(SAT 2) South Atlantic Area 2
frequencies
2854.0 - 5565.0 - 11291.0 - 13315.0 - 17955.0
Ground stations
Canarias, Cayenne, Dakar, Manaus, Johannesburg, Paramaribo, Recife, Rio de Janerio, Sal Island

There is a good worldwide coverage map at radioscanner.ru

http://www.radioscanner.ru/avia/maps/hfaero.jpg

Hi Tom

This is another for what it's worth reply.

I had the same problem with my Degen 1103 (purchased July 2004)
a couple of years ago and it was not intermittent. I stubbornly kept
using it on a daily basis (there was a lot of late night drama
on Art Bell's frequency (3840) and other frequencies around that time)
and after about two months its started to go away. The radio has been
functioning normally for the past year and a half.

Another FWIW: I have only used the batteries that came with the radio
(and they still work well), I only charge inside the radio, I only
use the non-UL listed Chinese transformer and adapter that I ordered
with the radio, the radio is on for about 4-8 hours/day (mostly off
the batteries - the transformer interferes with AM reception), and
the radio is kept in a non-smoke-free environment.

2184. External Antenna input impedance

Yahoo group: de1103
Date: 2009-05-17 11:00:10 UTC
From: silva_halide
Topic: 2169 Message: 2184

I have searched this list's archives for an answer to no avail.

Can anybody tell me the input impedance at the external antenna socket
on the DE1103 ?

I ask this because an (end fed) wire antenna usually has an impedance
much greater than 50Ohms requiring a balun to match the impedance.

from here
<http://www.hard-core-dx.com/nordicdx/antenna/feed/magbalun.html> :
"Some receivers have a high impedance input terminal
for random wire inputs- but there are still the
problems of bringing an unshielded wire into the
house."
(for the purpose of my question, the term random wire can just be
replaced by the word 'wire'. A true random wire is designed to be a non
1/2 wavelength of any frequency you want to receive on.)

Some other interesting links

random wire antenna <http://www.kc7nod.20m.com/random_wire.htm>
longwire OR random OR end-fed

Hi. Peter. The manual for my Grundig G5 says that the external antenna jack is designed for a 50-75 ohm antenna such a s a dipole fet with coax. While the manual does not say, I have found out from Eton that the external antenna jack attenuates signals. Since the receiver boards are virtually identical, the KA-1103 is probably the same. I have a KA-1103 as well as the G5, and they perform almost identically on the whip antenna, and on an external 80 meter dipole.

I'd say it's high, though like you, I haven't seen a definitive spec.
Firstly, there is little difference in plugging a hi z wire into the jack socket and connecting it to the telescopic, which of course is hi Z.
Secondly, my 50 ohm coax fed antenna shows a much lower signal transfer if I plug it into the jack socket than if I connect the tip to the telescopic. Finally, I also have the DE31 from the same manufacturer and they do have high Z outputs and work well into 1103's input. Despite the poor signal transfer, I use the coax fed antenna which has even defeated TV and computer interference on tropical band. Because, it doesn't overload the 1103 much, the performance of this radio with a low noise antenna and occasional use of the attenuator is staggeringly good for the price bracket.

Thanks Joe.
What you say makes sense. Although I had a look at two schematics that
are actually different (I'm not sure which is the most current and when
the older one applied), but in one schematic (DE1103sch.gif
<http://pagesperso-orange.fr/radio/Images/DE1103/DE1103sch.gif>) the
antenna input to part of the circuit is switched directly to either the
external antenna or the telescopic antenna suggesting a similarly high
impedance. In another schematic (de1103_main.jpg
<http://f1.grp.yahoofs.com/v1/QMYYStlSh9By-p0QEhlSm0pREOqat5Es4YemyH6wm5\
GF5nNQ4DflNhenAeOza1Opb4ed3sGhxjpe7nXDB9IJt11_nrozVmkARrWa/de1103_main.j\
pg>) the telescopic antenna first passes through a passive 4th order
BPF into a FET buffer (Q1) whereas the external antenna enters past a
330Ohm resistor (R105) via a different 4th order BPF into B1 (don't know
what that is) and converted into a buffered & balanced signal using Q7
and Q8.

I haven't dealt much with RF impedance matching before (mainly DC and
Audio applications) but it appears to me that at least on some DE-1103's
the input impedance seen into the external antenna socket is 330Ohm.

regards
Peter

Hi all,
I have same problem with external input impedance.
In these days I building an external antenna for LF-MW (150k - 1.7M).
In that "ferrite antenna" I want to connect a secondary loop to take signal,but I don't know the impedance of degen and I don't know how to calculate the turns ratio between main loop (loop to connect with variable capacitors)and feeding loop (to connect with external input in Degen)
Below the schematics of my external ferrite antenna.

http://img193.imageshack.us/my.php?image=ferriteantenna.jpg
Sorry for bad drawing....the writen are in italin,but in the left side of drawing says variable capacitors and in the right side says to degen input.

Who can help me?

regards

.....but what ?

A decent amateur shortwave radio costs three times the price you can't
afford (did you steal your radio too ?)

Calm Calm!

That program is only a good database reader!
if we consider that database is free!!!I think too the cost of the program...

I didn't want to offend anyone!
It's only my opinion!!!

regards

ciccio

Ciao Leo,
now I using EIBIview is free and is a good program for me.

[ITA]
Ciao Leo,
ho visto che la notte becchi bene radio rebelde...io sto ancora cercando di sentire radio habana cuba.Stasera ci provo di nuovo dalle 23 in poi (ora ita)sui 11770khz...spero prima o poi di riuscire nell'impresa.

Te verso che ora la senti radio habana? e su che frq di recente?

ciao

Ciccio

I once compared mine using the whip with a friend's Redifon R551N receiver which was using a long wire and antenna tuner. Sensitivity seemed about the same when receiving the same SSB transmissions.

I have done A/B tests with the same antenna between my RP2100 and DE1103. In most areas, the De1103 wins as it is simpler to tune. The outboard BFO on the RP2100 is more convenient than the thumb wheel on the DE1103. Sensitivity and selectivity are close, at least to my ears. If the RP2100 had a direct entry keypad, an adjustable ALC and tighter filter options, it would be very close to my ideal tabletop radio under $300.00

On AM, a tuned passive loop is a very good investment. Wind your own with a plastic milk crate, chunk of wall, etc., connect a broadcast band variable capacitor with a Vernier dial and either radio rocks. I'm a few miles west of Seattle and I can regularly receive 660 (station in central Canada), 1700 (San Diego station), and a bucket load of Wyoming, Colorado, Oregon and California stations.

My suggestion for both radios is to run them on fresh battery power and feed them from an outdoor antenna through shielded lead in. An antenna tuner would be a good idea too.

The 1103 receives LF, but there are an awful lot of am broadcast band signals around 400 KHz. I can hear a few beacon station through KOMO 1000 and other out of band stations. I'm looking to find an Elmer to build an LF converter kit for me for better LF reception. With all of the subs up here there is bound to be some interesting stuff.

73,

Gordon Cooper

Hi. I have compared My Kaito KA-1103 and Grundig G5 to my Kenwood TS-430S (Amateur Radio transceiver with general coverage receive). The TS-430S is both more sensitive and selective than the two portables (using the same antenna). This is to be expected, as the TS-430S ($800.00 when new, more if optional filters are included)is a larger, more expensive radio. The two portables come fairly close in sensitivity, but are not nearly as selective. The portables are more easily overloaded by strong signals.

As I have said before, compairing a $100 to $150 portable receiver to tabletop receivers costing much more is like comparing apples to oranges. The two categories of receivers serve different purposes. The G5, and the KA1103 are excellent in their category of moderately priced and easily portable receivers. They are not made or meant to compete with or replace the more expensive tabletop receivers.

I have done some subjective A : B test with my DE1103. The results are favorable to very impressive.

I compared SW/HF of the 1103 to TenTec RX320D and 4 (MW) AM BCB radios, DX'ing on the 540-1710Khz. I also looked at the FM band.

*****
Just for (MW) AM BCB DX comparison, it is fine and not good or bad.

I have a bunch of $30-$60 dedicated analog or digital AM radios. Some might be a little better in this band. The issue is the DE/KA1103 is a physically smaller Loop stick. You can of course use a passive coupling to an external loop (Such as a Terk AM advantage). I found the 1103 does not respond as well as some other radios. However it does pick up DX stations, especially coupled to a 9" external loop.

It is still great and the sensitivity and rejection is good. When dealing with weak MW AM BCB that are weak already, its very subjective to which radio is better. The 1103 always seemed to get every station any other radio did.

I would not say its the ultimate in AM radio for DX'ing. I find dedicated AM radios (cheap ones even) are hard to beat. However the 1103 has memory that analog AM radios do not. The accurate digital freq is good. I do have a Sony "boom box" with digital AM tune and it was actually better than the 1103.

The RX320D is a little better on the AM BCB than the 1103 with similar antennas in every way. However the RX320D is almost $400 (not including the PC computer to control it and antenna).

I also tried the amplified loop Degen/Kato (TG39, DE31. TG34, KA33). I used both the loop stick booster/repeater (where you lay the loop booster on the case along back near where the internal loop stick is located).

I also plugged in the TG34 active loop direct into the ext antenna jack. The TG34 is a generic Kaito/Degen antenna. I got it with the 1103 as a package deal on eBay. It seemed to work plugged in direct about the same as the passive method. The TG34 out right with shipping is about $30 and recommend it.

You can couple to the external ANTENNA JACK for MW if you use the trick/hack with scan. Other wise the only way to couple an antenna to the 1103 for MW is with a passive loop/booster. Either way works, but using the direct plug into the 1/8" phone ant jack you don't have to balance a loop stick booster on the case or try and position a loop

near the radio.

*****
FM RADIO 88-108Mhz - The 1103 FM receiver is VERY good. You may not care about FM, but I hate it when features are thrown into any product to pad the feature list, when they are half baked. The FM radio is excellent I am happy to say.

There is a college FM station one town over that is a challenge for my home stereo to get. The 1103 gets it with out an issue. It also compared to the Sony AM/FM/CD/TAPE boom box FM radio. The Sony AM/FM/CD/Tape Boom box has a VERY good AM radio section by the way (Model CFD-S33).

The only draw back of FM on the 1103, its one small speaker. It is the price you pay for small. It sounds fine, but the sound on headphones is amazing and in stereo of course. As a FM stereo radio on headphones, I say very good to excellent. The Sony has two larger speakers, more audio power (I think 1 watt) and a ported bass enclosure, so of course sound was better with the Sony than the 1103 on speaker. Again headphone on the 1103, amazing.

*****
For SW/HF I am impressed, sensitivity and selectivity for an sub $100 radio, impressive. It gives radios that cost 5 times a run for the money. Some complain about SSB operation, but some radios costing more don't even have SSB. There is a "clarifier" thumb wheel on the side, and its kind of small. I found all the controls small at first. Once I got my fingers calibrated to it, it was fine. It is best sitting on a table on its slick fold out stand. However I can manipulate the controls holding it in my hand pretty easily now. Because some program modes require two buttons to be held simultaneously that can be a little awkward. However you don't program it all the time.

It does compare to the TenTex RX320D favorably but the RX320D is more radio. If you factor in the size and self contained NiMh battery operation the 1103 is amazing. When it comes to the portability and quality and price, its amazing.

Sure $500 or $800 radios should be better, but not all expensive radios are better than the 1103. Some table top radios are just big, not better. The RX320D needs a computer to control it. However the versatility of the RX320D software makes it far better than a hand held battery portable. You have more control, filters, memory, displays. As far as pure radio performance, the RX320D edges out the 1103, but not by much. It is surprisingly close, but the RX320D is an amazing radio all by it self. So to even be close to the RX320D, I say WOW! I could not be more happy with the 1103 as far as value. It is a keeper.

This is all subjective. If you can get an old copy of PASSPORT 2006 edition, they review the 1103 and RX320D. They don't compare them

head up, they have them in their respective portable and table top categories. You can find a used copy it will give you more specs.

It is almost impossible to put fill your tank twice for less than this radio, so get one. The eBay China dealers are all good. Shipping times will be well over a week, up to two or even more. The wait it worth it. Of course the Kaito is import for USA dealers and the Kaito is the brand name for other markets and what you get on eBay discount usually. It is the same radio. Warranty I did not worry about, and with over a year trouble free operation I am still not worried.

Cheers George

From: Paul
Topic: 2194 Message: 2199

Hi George

Thanks for your impressions, I too have carried out an unscientific and purely subjective test between the 1103 and the RP 2100. On AM both MW and SW I found the RP 2100 had a slight edge over the 1103, sensitivity wise, both radios were about the same but I found that the signal to noise ratio on the RP2100 to be slightly better. When I say slight, I mean so slight it is not worth worrying about.

FM was a different story, I have found the selectivity on the 1103 to be abysmal, the amount of overload from local stations makes the radio all but useless for FM DX. The RP2100 fared slightly better and using the telescopic whip during an FM band opening from Australia, good signals were audible. Using an outdoor three element FM antenna improved things even more on the RP2100 but had little effect on the 1103's performance.

I suspect the 1103's performance on FM would be directly proportional to the number of local FM stations and the proximity to the transmitter. In Christchurch (New Zealand) where I am located, we would have one of the most overly subscribed markets, the city's population is only about 300,000 and we would have at least 15 high power stations and countless low power FM stations. As regards AM, the situation is slightly better we have about nine stations locally, with six of them being within a couple of miles from home. They all don't have their own masts, most would be co sited on the local Christian radio station's mast, I guess the rental would be a good source of income for them.

Regardless of my findings, it is my opinion that the 1103 and the RP2100 for that matter represent really great value for money, when one considers the high cost of a high performance receiver, the Drake R8A (EHam.net are quoting $1060 which would be a second hand price) which came out in the 1980s if my memory serves me correctly as an example, the manufacturers of the 1103 and RP2100 have made major steps forward in making a modestly priced good performance receiver available for the general public. Having said this of course, I bet what has happened has been that now the research and development costs on the technology would have been long since paid back, the prices of today would reflect this, just think of the high cost of a standard VCR or colour TV when they were first introduced.

Paul

From: aimo ruoho
Topic: 2200 Message: 2200

Hello, all group members. Nice to meet you!

At last I found this interesting group...

I got interested in legonedik s photos, where there was a nice
looking Loop Antenna.
Would you kindly let me know more about it to make an exact
copy of it, if allowed?

I built a rather same looking Loop using copper tube, but it gives
me very weak signal.

Best Regards to all by amigo Aimo

Hi,
I've received a la5030 wellbrook. I've tested with sangean ats909 and degen.
With this antenna degen suffer a lot... too much signal... while ats909 is
more reliable.
Hope to find soon a rg58 cable, now I'm using a rg59 and it's not the same
:-)

Hi Aimo,

"The gain of a loop is much less than a longwire, but it has much less noise pickup."(source http://www.frontiernet.net/~jadale/Loop.htm)
My loop is a single turn wire in plastic tube. Appr. 3 by 3 feet / 90 by 90 cm).
The variable capacitor is connected to the beginning and the end of the wire.
The pick-up coil is 1 feet / 30 cm in diameter and a massief copperwire.
One side to the inner of the coax and the other side to the shield of the coax.

Hope this helps a little....

From: linoalmeida42
Topic: 2203 Message: 2203

Hello pals!

Who knows about connecting a degen 1103 to a PC.Is there a mirror program or something like that? I have this receiver,live in São
Paulo city and have problems about noise and eletronics interferences.
My antenna is a long wire directly connected to the receiver.
Thanks all.
Lino

Hi Lino. For what reason do you want to connect your Degen DE1103 to a computer? If it is to program the radio, there is no provision for this. You can however connect the line output of the radio to the line input of a computer's sound card. This would allow using the sound card in several ways. You coulsd (with appropriate programs) do some audio filtering of signals, and/or receive fax and digital mode signals.

or, go to http://www.audio-tool.net/ and download audio recorder for free which will allow you to record what you here. Unless you use adequate filtering, the only practical use you can put the radio to is recording FM stations.

2210. Re: degen connection

Yahoo group: de1103
Date: 2009-06-11 01:47:45 UTC
From: Gordon Cooper
Topic: 2203 Message: 2210

The problem I have had with trying to get a signal from my DE1103 to my computer is the massive amount of noise the computer input adds to the radio. I bought a Signal Link device that was supposed to eliminate common mode rfi, but using that as a bridge device adds even more noise to the radio. I have tried the same technique with my RP2100 as signal source, with the same results.

I'm beginning to think that the only viable solution is an optical link between the radio and the computer.

Hi Gordon

Before you experiment with other devices, run a test to see how far you have to be from the computer before the noise diminishes. With my computer running I have to go outside and almost to the end of the drive (about 50 feet) before the noise has gone completely. I am using the same gear as you are.

Dear Paul:

Will try tonight. I have a 30' extension cable for a mini plug. I'll put
the radio outside, then run the line to the computer. Both are on
battery power, by the way.

That may work but, if the noise is coming via the wire, you won't be much better off. Others may be able to advise on filters that you could use.

Aimo,

It is fully featured and very useful software.I use this for recording audio from DX stations. However, you have to install another small programm named "lame" with this Software.

While not in my shack, I use a Creative MP3 recorder instead.

Regards,

SG

I also run a Kenwood TS430 S (two actually), and about a year and a half ago I had a cw contact with a /mm (maritime mobile) out in the Pacific from here in Pennsylvania. I was running 100 watts to a dipole antenna and believe it was 40 meters and on the gray line. After the contact I switched in the 1103 and using my tuner as a preselector he was readable. It was enough for me to believe it would make a nice casual cw qrp rx with some filtering and of course a tx. Jerry.

2218. DE1103 below 76MHz !

Yahoo group: de1103
Date: 2009-06-14 21:44:14 UTC
From: ok_3022
Topic: 2218 Message: 2218

Hi,
as you can see on youtube.com, it is possible to tune DE1103 on FM below 76 MHz to 65 MHz!

Here is the link:
http://www.youtube.com/watch?v=Y4QTEyM13Ds

Anybody knows this modification trick?

Mr.OK_3022

2219. Re: DE1103 below 76MHz !

Yahoo group: de1103

From: silva_halide
Topic: 2218 Message: 2219

Aha ! I have some answers . I decided to email the poster of that youtube video and they were very responsive and helpful.

I am going to explain what the video poster claims for two reasons. Firstly because I have not tried this out myself, secondly because their reply to me was over a couple of emails and in slightly broken English and I wanted to clarify what they wrote before posting to this list.

Firstly looks can be deceiving. Even though that video shows the display going down to 66.27MHz, the device will only tune down to 71.8MHz (or even 71.0 in some DE1103's), whereas the display continues to decrease, nothing is received/tuned below 71MHz.

The other piece of information is that there is no guarantee that the following method will always work to be able to get down to 71MHz. In fact the information I received suggested that this method will most often not work and that you are lucky if it does ! The poster wrote that "sometimes in some receivers (as a result of accidental bug or during the power reset) in memory cell the DOT emerges (instead of number of cell)." So armed with that information here are some instructions:

1. Somehow cause your DE1103 to display a DOT (period/decimal point ?) in the memory (MEM) number at the top RHS of the LCD. Perhaps by performing a Master Reset or some other unknown method. Note that if you can't get this to happen don't despair because it is unpredictable and perhaps caused by a bug or a faultOnly in some pieces.
2. Press "M/F" and begin manual scanning with the wheel for a long time until "B72.90" or something similar appears
3. Store this frequency for future use so you don't have to get the elusive DOT appearing each time.

Let us know if you have any success with this method ....

regards
Peter

From: silva_halide
Topic: 2218 Message: 2221

Hi folks,

about 10% of my posts to Yahoo discussion groups never make it though, and I have no idea why - very frustrating as I need to retype the entire message.

Anyway I have some information about this apparent capability of the DE1103 to go below 76MHz. I contacted the poster of the youtube vide and they gave me this information (I have not tried it out myself to verify it)

Firstly you should know that even though the display on the video goes down to about 66MHz, the tuner will only receive down to 71.8 (or 71.0) MHz.
Secondly this appears to be related to a bug in some units and you might not be able to get this with your unit.
Here are the steps:

1. The goal is to get a DOT (a period/decimal point ?) displayed in the memory location (MEM) indicator at the top RHS of the DE1103's LCD display. One suggested way to achieve this is to Perform a Master Reset of your DE1103. If that doesn't work then I really have no other suggestions for you !
2. Once the DOT appears, press M/F and begin manually scaning with the wheel for a long time until "B72.90" or something similar appears.
3. Store the frequency into memory for later retrieval. I assume once it is in memory you don't need to ge tthe DOT to appear again each time.

Let us know if you manage to reproduce this on your DE1103 !

regards
Peter

2223. Apologies for the multiple posts

Yahoo group: de1103
Date: 2009-06-17 03:32:37 UTC
From: silva_halide
Topic: 2223 Message: 2223

Dear list,

Yahoo groups has inconsistent behaviour which resulted in an excessive number of replies to the last topic getting through.

Only 1 out of 4 of those replies actually came back to me as an email leading me to believe that the remaining 3 replies never got to the list.

Sorry for the inconvenience.

regards
Peter

THANK you very much legonedijk!
I really appreciate your answering my question.
Nice to see so much interesting material about Loops.

I received the DE 1103 from Hong Kong 16th of June.
It cost me USD 45,60 ,which was the offer by eBay + 22,00
for handling and mailing.

The very small handbook doesn t tell me, how to go to LW
frequencies (under 300 kHz) or the "in-between" channels.
Do you know how to do this trick?

I have not tried to connect any external antennas to it, because
I read about the possibility of destroying the 1st FET (?) by doing it.
Would any types of 2 common diodes prevent the shock?

Best Regards from Aimo, Torrevieja, Alicante province, Spain.

Hi Aimo,

"The gain of a loop is much less than a longwire, but it has much less noise
pickup."(source http://www.frontier net.net/~ jadale/Loop. htm)
My loop is a single turn wire in plastic tube. Appr. 3 by 3 feet / 90 by 90 cm).
The variable capacitor is connected to the beginning and the end of the wire.

The pick-up coil is 1 feet / 30 cm in diameter and a massief copperwire.
One side to the inner of the coax and the other side to the shield of the coax.

Hope this helps a little....
Reg.: jan

Hi Aimo,

Nice price....USD 45,60+22,00.
I had to pay 120□ ex. handling from a seller
here in the Netherlands.
After all, I love the radio but not the seller...

"In-between" channels or low frequencies can be set directly.
For example: select 150 using the small buttons.....than the "BAND +" button.....thats all.

About the diodes....i don't know.

Hi Aimo - I think you'll find that all 1103's over the past couple of years have a tiny "add-on" board with 2 diodes back-to-back from the telescopic antenna to earth. The normal antenna input on the side feeds tuned circuits and attenuators, so I guess they aren't needed there.
Bob.

2235. Links to Yahoo pages don't work because ....

Yahoo group: de1103
Date: 2009-06-23 14:11:39 UTC
From: aircheckl over
Topic: 2235 Message: 2235

Hi Everyone;

FYI - quoting links to Yahoo Group pages generally does not work.
Why? Yahoo pages have "soft" URL's which are changed every couple hours. This is why a link will work one day and not the next. Best way to direct someone to a Yahoo Group file might be, for example, to quote the URL to a specific folder, then name the file to click on ...

http://groups.yahoo.com/group/de1103/files/Preamp%20FET%20Replacement/
and click on the files named "FET_2.jpg"

Hope that helps since Yahoo is so confusing.

-Mark

Well!
"here" did not work at all! - "this one" gave the original
Handbook pictures with texts. At least I received that
with my one-week-old DE 1103. The package cost me
USD 67,60 straight from HongKong through eBay post
paid...They had forgotten to include the guarantee card,
but for the low price, I would not care less! Perhaps I
will buy another, but of a different colour?

For months I used to read about this small "wonder"
for a receiver with interest, but could not believe all that
had been written... It probably is not a DX-receiver, but
beats with its sound my TEN-TEC RX340. With a few
tricks it might even catch some low-powered stations?

I have not tested it with an external antenna yet in fear
of burning the RF FET.

Is it really true, that its sensitivity can be so low in uV:s?
The handbook gives < 20 uV, but some DXers claim
1uV or better on SW. Whom to believe?

Best Regards from a Finnish DXer living in Spain.

Thanks a lot, Mi Amigo Holandes!
We call and know best your country in our
Finnish language as "Hollanti"...We also
use sometimes the international name:
"Alankomaat" (Nederland). Your stamps
seem to use the latter term though.

I finally found the right place from my own
handbook also.

Thanks again and 73 de amigo Aimo!

Hi Aimo,

Thanks for all the info.

You wrote also that you will buy a second 1103.
That is a good thing to do....one for experiments.

I was capable to recieve weather HF-Fax/Navtex with the 1103
using a mini windom antenna/RF-systems.
The line-out from the 1103 connected to the line-in/soundcard
of the desktop computer and using a program to decoded.

The 1103 is a nice, cheap little receiver.

Thanks for your list!

I wonder, why R.France has been deleted from the list?
Would you kindly give me an answer, please?

Aimo Ruoho, a veteran DXer from Finland, spending his retired days in Spain.

Hi. I have personal reasons for deleting the entries. I do the list mainly for myself and a few friends. I mentioned it once in this group (or was it the E5 group?) and was asked to post it to the files section. You can find the list that I condensed my list from on the Prime Time Shortwave web site.

Thank you!

I think, that you made your motive as clear as you possibly could.
It just seemed so unfair to me to learn, that you deleted R.F.
I would not have noticed or even thought about it without you yourself
having mentioned it. That made me think, that perhaps you have had
earlier in your life bad experiences with either Radio France or French
people. That would explain this discrimination to my old brains...

Thank you again for your rapid responce.

Au revoir, Aimo ton ami (?).

2243. DE1103 CURRENT FRECUENCY VALUE TO PC

Yahoo group: de1103
Date: 2009-07-13 17:53:11 UTC
From: notareallyreal
Topic: 2243 Message: 2243

Hello !
I would like to read current frequency value to PC (RS232).
Has anyone any ideas for this or have you heard/read that someone has already done it ?
Perhaps from Display unit ?

For FM DXing I am already reading RDS information from DE1103 to PC.
I am using RDSDX-program:
http://home.scarlet.be/~wijnherm/rdsdxabout.htm
with decoder-hardware:
http://home.scarlet.be/~wijnherm/barnabas.htm

It would be quite nice atleast read frequency values from DE1103.

BR

2244. almost no reception using ANT connector

Yahoo group: de1103
Date: 2009-07-19 15:22:19 UTC
From: p_czapski
Topic: 2244 Message: 2244

Hello folks,

I am new to this group. My name is Pawel, SP5REG, from Poland.

There is some malfunction to my DE1103 that I cannot figure it out. Using whip antenna shortwave reception is fine, but when I connect antenna through ANT the radio is almost deaf. So I have opened the radio and seems that ANT connector soldering is fine. Is it that NM-139 (IC-6) got spoiled so it must be replaced? However, when I connect my roof antenna with the whip then radio reception is fine.

BTW. When opening the radio I have noticed brown cable going from around C224 place to nowhere. Probably it got cut while opening the radio. Any idea where does it have to go?

Regards,
Pawel, SP5REG

In looking around on the Internet, it is disappointing to see that almost all of the web pages devoted to helping a new (or aspiring) SWL are so outdated. All of such pages that I have found so far are qt least four years old, and thus make no mention of the Kaito KA1103/Degen DE1103, the KA/DE1102, the Eton E5, or Grundig G5. These radios are clearly (in my opinion) some of the best value-for-the-money Shortwave receivers made today.

Yes, there are web sites that review these radios, but the articles on choosing SW receivers that I have seen all are out of date, and some even recommend receivers that are no longer available (except used of course).

Maybe I will have to write my own page. I am not new to SWLing, but it would be nice to have someplace to point interested parties that was more up to date. If anyone knows of an up to date web page on sellcting a shortwave receiver, I would appreciate if if you could point me to it.

Hi Guys. I have been to the monitoring times web site. Their Getting Started in SW Listening 3 part article has some good information, but it is obviously out of date in the section on how to buy a shortwave radio. Basically they are saying that you cannot find a decent receiver with SSB capability in the "$100 or under" category. I can find lots of reviews, but more information is needed for a beginner to choose the right radio. They need to consider where and how they want to listen, and what types of signals they want to listen to. They need to have things like sensitivity, selectivity, and bandwidth explained clearly. After these things are learned and considered is the time to look at reviews. And yes, I have been to eHams, and Radiointel.com, and many other sites with reviews .

What I was really looking for is a site that explains what a beginner needs to know to choose a radio, and is kept up to date. Especially as to what radios are available currently.

A further problem is that many of the reviews available on different
websites are copy and paste jobs that have appeared on other sites.

I found out about the 1103 after reading a review on the 1102 that appeared
in a DX club magazine.

Congratulations Gabriele.

As per Bill's post I assume you are referring to a transmitting license rather than just a listening license. (As I too thought that SWL means "ShortWave Listening")

It's not a website but I would suggest you pick up a copy of the 2009
edition of Passport to World Band Radio. Very well done chapters on
how to choose a radio and then reviews of all the different models.
Eton, Degen, and Kaito models are all well represented. plus there's
nice information about SW and geographical interest stories as well.
Worth every penny.

ok maybe "license" is not the proper word, maybe "authorization" is better. In Italy with a sample request and aftre some research from postal national service you can obtain an id for listening (yes swl is short wave listening).
To listen is correct, the only thing everybody needs is a receiving device as our great degen. But to send and receive QSL cards to HAM station ad to subscribe to National Radio Associations (like ARI) or to acces to International IARU QSL Bureau you must have an id, at least a sample swl id.
So guys go on! Let's listen to 7050-7100 with degen and external wire ant, first step to HAM license.

Hi Paul,

I live in Sydney, Australia and the concept of requiring a license to listen to Shortwave radio is very foreign to me . The only non-public communications I have come across so far with my DE1103 is a pre-recorded weather message from our local airport.

Police radio went to encrypted digital ages ago here in Sydney so I can't think why people listening to Shortwave in Sydney need to obtain a license to prove they are somehow a responsible citizen. In countries where people require licenses for SWL what kind of programme content is your government ensuring you are qualified to listen to ?

regards
Peter

Hi Peter

In New Zealand where I am, no licensing for receiving is needed, there was once a radio licence everyone with a radio had to have but this was discontinued in the 70s. It wasn't until 2000 that the government abolished the Broadcasting Fee (TV Licence). As far as the Ham licence is concerned, a licence is required, it used to cost $6 a year then went up to $49 for the year and then a couple of years ago, the fee was abandoned completely. The justification the government gave for the increase in the fee was the amount of administration in other words policing the service that was needed. The counter argument from the hams was that the amateur service was self policing and that the increase was unwarranted.

Paul

The amateur radio service is justified to provide, in the case of emergency, qualified and trained operators and equipment. Many examples can be cited where amateurs were the only emergency communication sevice available. Today, with many 12VDC and battery operated equipment it is even more available for emergencies.

Perhaps you are not aware, in the case of emergency especially when life or death may result, you are fully autherized to operate any equipment on any frequency or power level as necessary to resolve the situation. Never hesitate! I have modified several equipments to operate on other bands outside of amateur radio.

In an emergency, Morse code may well save a life, perhaps yours. I encourage you to learn it even at one word per minute. Get your boy scout merit badge or whatever will get you to learn the code.

Long live amateur radio!

Hi Guys. I am not aware of any country that requires a license or permit to listen to Shortwave at present. There used to be SWL clubs that that would issue a number to members. I am not sure if that is what the original poster meant. No specific type ID is needed to send a reception report to get a QSL card. The station you want to QSL from will need your name and address.

Many hams now use eQsl (www.eqsl.cc)to send and receive electronic QSL cards to each other. It is much quicker, and less expensive.
However, an SWL cannot used the eQsl site. In adition, many Shortwave broadcasters do not ask for or reply to reception reports.

From: Dr Gabriele Mazzantini
Topic: 2264 Message: 2264

To martin: in italy is the national postal and telecommunication service the only organization authorized to give swl id because transmission in air is still restricted to national service as primary use and in some case authorized to third party, often paying a fee (in example radio station). In italy you subscribe to asso aftre having a swl id in most cases... is not the rule but most important assos do.
Surely i can tell you a low says that is forbidden to anyone else different from postal service to release codes and is forbidden to ear frequencies of services. We can only ear hamateur frequencies that are written in another law.

Silvia, here in italy too most of service are cripted and out of our degen range but state taught to leave himself the power to come back. You can figure that in italy AIR is stil property of the state that give you in some sense authorization to use it... In simple words i must beware of memories in degen not to put forbidden frequencies on it, is forbidden and in lot of cases penal.

In how many other countries is it illegal for a member of the public to listen to certain SW frequencies ? What is the government afraid of you hearing ? Police frequencies with unencrypted conversations ?

To the best of my knowledge it isn't illegal in Australia to listen to any SW frequency.

Peter, silly as you want but that is..... the authorization (and the Italian Code of Telecommunicqtions) clearly specify "only HAM ferquencies"
HAm have an exam, an authorization to put rtx station, and annual fee.
11meeters have an authorization and a fee
marine vhf have an authorization and a fee
PMR have a fee but free use, no author
Swl is free but authorization recommended and requestible, fee not due from 2003 if i rmembre well.
Is like you request the use to the owner, always.....
I dont think they are afraid of something simply they retain a right to ask for fee.

Congrats I016OPI !!

FYI - Another association issuing callsigns is SWARL.org
SWARL stands for ShortWave Amateur Radio Listening

"Devoted to Short Wave Listeners primarily interested in monitoring the Ham Bands and participating as SWL's in the various Ham Contests. Open to all SWL's and Hams. Secondly shortwave broadcasts and even AM radio logging and other related subjects with in the radio hobby."

They have a Yahoo group too.

Mark

Hi, no need to worry about an external antenna if it's a new one.They now have diodes to protec the FETs. I've connected 100 metre wires and a full size T2FD to mine and the performance is incredible! Of course, you must use an ATU as the Degen does not have switched bandpass filters or preselector, but for $50, I'm impressed to say the least!

2275. Re: [de1103] Degen 1103 vs 1102

Yahoo group: de1103
Date: 2009-08-03 22:13:55 UTC
From: martin
Topic: 2274 Message: 2275

Hi Johan. I do not own both receivers right now, but I used to own the KA1102 and at the same time I had my Grundig G5. I now own a KA1103 as well as the G5. Side by side the performance of the G5 and KA1103 is identical. I did compare the KA1102 and the G5. See my review of the Gr here:
http://home.mchsi.com/~kb0hae/index.htm
Of the three, the G5 is the easiest to program. Programming a lot of frequencies into the KA1102, and KA1103 is a bit tedious, but not difficult. The G5 and KA1103 are definitely a little more sensitive and selective than the KA1102.

The KA1103 has more memories (256). On the KA1102, the BFO (SSB) only works for memories stored in page 9 (there are 10 pages of 19 memories each). You can listen to SSB/CW stations that are not in memories, as long as the radio is set to page 9. Page 7 can only be used for FM broadcast stations, and [age 8 can only be used for AM/MW broadcast stations The KA1103 does not have memory pages, and all of its memories are capable of storing any frequency/mode the radio is capable of.

The KA1102 also has a problem with its BFO on higher frequencies. There is a noticeable warble when listening to SSB/CW signals above about 15Mhz.

The ATS function of the KA1102 works on all modes/bands. The KA1103 has this function for FM broadcast band only.

For the small price difference between the KA1102 and KA1103, I would say get the KA1103. Of course the same holds true for the DE1102 and DE1103, as they are the same radios as the KA1102 and KA1103.

I suggest that you read all of the reviews that you can find, and read the manuals for both radios before making a decision. The eHam web site has quite a few reviews of both radios.

Topic: 2244 Message: 2277

With the internet, google, user groups or yahoo groups like this one and others, there is no excuse for a newbie not logging on and saying HELP. I was out of radios for +25 years and just go back into them last few years. That is what I did and how I found the DE1103. I first bought a TenTec RX320D based on research and got a used one on the ebay (which is rare since people hold on to them).

Yes many things change, but be glad that new radio models are being made. Sadly some good ones are out of production. No doubt cost to make them and market drives that, as well as new technology. I know a guy who makes aircraft "glass" instruments for experimental aircraft. What happens is manufactures of key vendor components say they are not making that display or chip any more. This forces manufacturers of electronics to discontinue models, like it or not.

I appreciate your comment but there is no excuse about not having enough info available. Look at the date of the article. If it is over a year old it is out of date.

PASSPORT is a good annual book. You can get used ones on Amazon for a few bucks. Even a used one a year or two or three old is OK since it has so much back ground info and logic on how they review these radios. It really helps in general knowledge and shows you all kinds of models. You may really desire a used out of production radio more than a new offering. The Grundig S800 and Sony ICF-SW7700 are examples of good radios out of production.

However I think a KA/DE1103 has room in almost any radio collection. especially for the $90 or so.

Right now I am a NEWBIE all over again. I am restoring old TUBE radios. This is a whole new world to me. With out the Internet I would be lost. It really is helping me with my understanding of RF circuits and of course tubes which always have fascinated me. I am re-capping them, aligning them and making some very nice sound with them. The point to point wiring and no IC chips and big IF cans and tuning coils really makes it easy to see what you are doing.

So old info is valuable even if it is only for being historical.

Cheers

From: gmcjetpilot
Topic: 2274 Message: 2279

One is a 1102 and the other is a 1103 so it is one better..... ha ha,

Sorry I could not resist. The 1103 is the way to go. At first i was kind of turned off by the *big* band and freq display, but I love it. It is nice to see where you are in the spectrum.

The 1101 and 1102 are both highly rated. The 1102 I think is a little bigger in size. For what it is worth the Passport rating of the three Radios are:

Degen 1101 - 2.875 stars
Degen 1102 - 3 stars
Degen 1103 - 2.875 stars

The 1103 gets dinged in reviews for ergonomics. The big complaint is the tune/mem/volume/set scroll tune knob does 4 things. To set volume you have to push VOL and set level and than it goes back into default tune. The quality of the controls are top notch, including the tune dial. I find it took some getting use to but it is no big deal. You set the volume and 99% of the time you tune the radio. I really like it.

I think radio wise the 1103 is hands down a winner. I guess if you are a giant with gigantic hands with little dexterity in your finger tips (or wear gloves) the small size of the 1103 might frustrate some. I think the 1101 and 1102 have separate dedicated Vol controls which is a big deal to some reviewers. To me it is no big dial. Performance wise 1103 all the way.

big band and freq display - Nothing is BIG on this radio but SOUND and reception. It has small display, small labels and small buttons. It takes a little getting use to it, but I LOVE HOW SMALL IT IS. I Can put it in bag and take it on a trip. To help manipulate the controls setting it up on a table with its built in stand really makes it easy to handle. With the SW/FM antenna out, which is quite long relative to the small chassis body, you have to watch where you swing the long antenna. None of this is a draw back just the design of being so small.

Last is if you want AM or MW with the internal antenna it is not going to be the best performer, good but not best. Again it has to use a smaller loop stick. I doubt the 1102 is much better. I use external tuned LOOP antennas (both passive and amplified magnetic). Still the small size means the internal antenna is smaller. I looked into the technical data and how they tune the antenna circuit is top notch and very clever. If all I did was MW DX'ing this would not be my first choice. Again it is very very good and does everything well, including stereo FM (with good headset) and of course SW/HF. For the price you can not lose. I have about 20 radios, and if I could only have one protable, the 1103 was my only radio, I would be happy.

Cheers

Have any of you used the FM radio on your DE1103? WOW!

I don't listen to FM on my DE1103 much, but when I did, I was blown away.

First for stereo you need a headset of course. I have a bunch of typical high end "ear buds", but I plugged in my Sinnheiser HD 280 Pro full cover head set. WOW the FM stereo is so spacious.

Second is sensitivity. I went to FMFool.com and got all the stations from my address: 19 near, 29 mid and 18 fringe. They list them in dB power not just distance because of other factors (power, antenna height, terrain, etc).

THE SENSITIVITY IS SO GOOD IT BLOWS MY MIND. I got most of the fringe stations in my house on the first floor with just the whip!

The weakest or fringe stations of the 66 stations is a 49KW station 120.9 miles and a 100 watt school station 33 miles. I get that station and most all of the stations including fringe stations. That is impressive.

GIVE YOUR DE1103 FM A TRY.....

2281. Re: Have any of you used the FM radio on your DE1103? WOW!

Correction, I stated I was getting a station 120.9 miles away, but it was another closer station, 100KW at 57 miles, FMFOOL.com did not list. I used radio-locator.com and found the close station. I should have waited for the station ID.

Anyway, the point is the FM on the 1103 is pretty darn good. I can get stations in the +50 and +60 mile range inside the house with the whip antenna. Local stations with a high quality full headset, the stereo sound is amazing. Cheers

Hi. I have used the FM on my KA1103. Its pretty impressive. What I nlike best is the selectivity. Its far better than the two high end stereo receivers we have. both of them are totally overloaded by the 50KW station whose antenna is about 1/3 mile away as the crow flies.

I was amazed at the distant stations that the KA1103 (and mg G5) could pick up without interference from the local powerhouse FM station. I don't listen to FM much, but sometimes I connect the KA1103 or the G5 to one of the receiver inputs so I can get the stations I like, all three of which are more than 30 miles away.

Hi

Performance on the 1103 on FM and other radios for that matter depends entirely on location, I have found performance on FM to be extremely poor, as regards selectivity, I would ask what selectivity?

In an area where there are a number of moderate to high power FM stations the 1103 is subject to considerable overloading, it matters not if an external directional antenna is connected, the result is the same.

My RedSun RP2100 on the other hand is not subject to overloading with the external antenna and out performs the 1103 by a country mile.

From: aircheckclover
Topic: 2280 Message: 2285

Good thread. For fun I just grabbed my 1103 & 2100 (Redsun) for a shootout. Both virtually identical performance here in a high-RF area: BAD !!! (images, de-sensing, intermod distortion, etc.)

But not to worry - RF around here is so bad every FM radio I've owned - including car radios - dies under these circumstances. Only exceptions have been the Grundig Sat 500 & 700 and a McIntosh MR78 (hardly portable) - and even these radios struggle w/ de-sensing & overload.

I've had both the 2100 & 1103 in the country miles away from transmitters and both have been impressive as heck.

In town the whip on both radios is never pulled out. Keeping the antennas short acts as RF gain. Both radios need gain reduction to give clean local plus up to about 50 mile radius ability.

Mark in Milwaukee

2286. DE1103 FM-filter modification for better selectivity

Yahoo group: de1103
Date: 2009-08-11 07:11:26 UTC
From: notareallyreal
Topic: 2286 Message: 2286

Hi folks !
I am planning to change FM-filters.
I suppose that the existing filters are 180 kHz.
New filters could be:
Murata SFE10.7MJA 150 kHz or
Murata SFE10.7MHY 110 kHz or
Murata SFE10.7MTE 80 kHz
If you have done the modification,
what filters (combination) have you found best ?
I dont want to make selectivity too tight because it effects to RDS-signal reception (MPX-output).

Hi,

I´v changed two FM-filters 10 months ago and achieved the best results with this combination:
SFE10.7MJA 150 kHz + SFE10.7MHY 110 kHz
The selectivity is improved but not too tigh
therefore the RDS-signal and stereo-effect retained.
In case you use the combination 110kHz + 110kHz,
you´ll reach the highest selectivity but RDS-signal lost
and stereo-effect slightly distorted.
I can highly recommend the modification as the DE1103
thereafter is able to receive more station then before.

Martin,

I think your short article is great and would be useful for someone interested in purchasing a shortwave radio for the first time (or for the first time since the de1102 came out). The question is how would someone find your site? You could conceivably get it listed in AC6V.com. Rod Dinkins died last year but his son is still maintaining the site.

Other comments
The radio reviews were good.
I am going to make one of your antenna reels. Great idea.
I think Radio Moscow or Havana has a lot less propaganda than most of our local radio stations. Voice of Korea would be a better example and it is a lot more entertaining (funny) to listen to.
The DE1103 is currently $75 shipped from Liypn or Tquchina on ebay.

2293. How to calibrate the frequency display?

Yahoo group: de1103
Date: 2009-08-16 20:24:09 UTC
From: norsk4488
Topic: 2293 Message: 2293

Hello all. Although I don't have the KA1103 I do have the almost identical twin which is the Eton E5. While the exterior design is quite different the internals are I believe the same.

I have just received my Eton E5 and the display is always off by 1 kHz. I hate to send this back since I got a really good price on it and I believe that there is likely a very simply trimmer adjustment that can correct this very easily.

If anyone can clue me in about how to do this please post up.

TIA.

Bill

How do you see the RDS signal? Is there an outboard display somewhere
out there for the 1103? An RDS and the 150 KHz filter sound like a
winning combination!

Hi Gordon,

2x 150kHz IF filters is good for RDS, it is not problem.
You must built output from FM demodulator for external RDS decoder with TDA7330 and use software RDSDX!

It work very good. I use it too!

Best regards, Jara "Rat" Czech republic, EU

I recommend you send it back. A few posters have had this issue but most E5/G5/DE103's are fine in this regard. A friend of mine got a used E5 cheap and it had a frequency offset of 2 KHz. Since there is no service literature available I told him I couldnt' align it for him but he asked me to try anyway since he had little to lose.

So I tried but I could not get it any closer without sacrificing perfomrance so I ended up setting it back to where it was. Without service literature there's no way to determine if a simple alignment could fix it or if the problem is deeper, such as an out of spec IF filter, in which case no adustment could make it right.

I know it's pain exchanging the radio...but you'll be happier when you get one that's right..it's worth it.

Hello Jay...

Thanks for the quick response.
Yes I just got off the phone with Eton, and they too said send it back to the retailer. The only bad thing (retailer will even pay for return shipping..very goog) is that they have no more new units in stock..so I guess I might be buying a Kaito KA1103 (Degen DE1103) from someone else....

The radio is usable and I only paid 70$ for it. But in SSB mode it is annoying.

Thanks again!
Bill

There has been several postings about changing the filters for better FM selectivity, has anyone done this for AM? specifically for CW?

In that case perhaps they'd issue a refund? I would think they would have to. The G5 is still readily available, such as through Amazon and several other reputable retailers. But don't wait too long...they are out of production.

To follow up contacted the retailer and they are giving me a credit of 30$ USD and allowing me to keep the unit. It is very usable and that problem is the only one actually. So I only ended up paying under 40$ including shipping. I'm satisfied with that. The warranty is still good as well.

2302. DE1103 sold on Ebay as new with USA 1yr warranty..is that possible?

Yahoo group: de1103
Date: 2009-08-24 03:05:32 UTC
From: norsk4488
Topic: 2302 Message: 2302

I recently was scanning Ebay and came across a seller that is claiming that the radio he is selling comes with a 1yr warranty. The reason I question this is because I thought only the Kaito KA1103 came with a warranty in the USA. Since the Degen brand is not distributed here..
Anyone know what the story is? Lots of people would be interested. I am looking to by a 1103 pretty soon.

Most of the Chinese products do come with their 1 year warranties but the problem is that this warranty does not cover the cost of return shipping. So for relatively expensive radios the warranty is protection for you but with an inexpensive radio it will end up costing you so much to ship it for repalcement that it may not be worth it. Even when the sellers go the extra mile and pay to ship the second item to you, you will still pay about $30 to return your radio, so for radios under, say $75 total it is not worth taking advantage of.

This is one of the risks of buying from China, but the upside is that QC has been reasonably good from Tecsun and Degen. I have bought well over 40 radios this way and have had two bad ones.

Hello Jay...

I like hearing other's experiences with such things. I know that the seller on Ebay I am referring to indicated that the 1yr warranty will be handled from Illinois, USA. Whatever that means. So I guess all one would have to do is pay shipping to Ill? Right?

I really would like to buy one of the 1103 just to see if the hype is totally justified. I know that with the E5 (close cousin to the 1103 with the same internal electronics supposedly) I just bought it doesn't seem to be. The E5 is a nice radio that is pleasant to listen to and is pretty good but still doesn't seem as sensitive for serious DX and HAM listening. Yes the Sony doesn't sound as good as the e5/g5 but they don't seem to be all business like the 7600GR. I have compared the e5 and 7600GR side by side and while the e5 comes close in sensitivity, it just falls short, and of course it lacks the sync detector. But I got my brand new E5 for 39$ shipped so I didn't feel as dissapointed. The most noticable thing aobut the e5 is that is feels fragile, and as many others have noted the QC is just no where near that of the Sony 7600GR. The biggest gripe with the 7600GR is sourcing a noiseless AC adapter for it. In Japan Sony has one included with the radio. Sony USA doesn't for some stupid reason.

Bill,

That's intersting...I haven't heard of a US seller selling the DE-1103's with a US wrranty...why don't you share the link to this sale so we can see it. Perhaps I'll pick up a spare if the price is reasonable.

In terms of performance I can verify from personal comparisons of several units of each that they should all perform identically... there were a few improvements to the DE1103's over the years but the changes were fairly subtle and recent DE1103's perform identically to E5/G5's except for the feature diffrences. I even have a very early DE-1103 and it is not that different.

And they shoudl all be very sensitive...in fact the most sensitive radios on ALL bands in this size...I've never compared any other portable near this size and price that matched them for RF performance overall.

You say your E5 "doesn't seem as sensitive"...as what?

For anyone that saw my mesage about an E5 for $62 deleivered, Ignore it (I have now deleted it, but dealing with Yahoo...who knows). After going back and reading the fine print, I found that I ordered an E10. A nice radio, I have two. Not that spectacular a price though. I have asked that the order be canceled. Sorry for any confusion that I may have caused!

From: ian.campbell99
Topic: 2311 Message: 2311

My Degen 1103 seems to have died. It won't power on or respond to any of the buttons. I have done a reset - no good. It didn't respond to that at all and it didn't even change the clock setting. I then took the batteries out and left it for 3 days. Put in a set of freshly charged batteries but still no response. The clock went to 0:00 and then started going but not the radio. I can't even set the clock anyway. Several more resets had no effect. The wall wart I was supplied with can't be used here in Australia because it is for foreign sockets. I will have to get a converter and try that.

Has anyone got any ideas what I can do to revive the 1103?

I don't have an answer i'm afraid - but I would be interested in any replies! My 1103 worked fine until it was shipped from the UK to OZ with the rest of my household stuff - all packed in the orginal box, batteries removed, etc. I came to use it after waiting over 3 months for the goods to arrive by boat, only to find it had died - no power from batteries or mains adaptor - No clock, no lights, nothing - so if anyone can suggest what to check internally, im happy to try - I can't break it any further! Im hoping its just an internal fuse or capacitor.

Hello,

It happened to me a year ago, after a couple of months of humid weather.
I left it without its 4 batteries for about 12 hours, and it went to
life again when, after that, I placed the batteries inside it again
and turned it on.

Hi - I got interested in this one - grabbed the circuit - no lithium backup battery or anything like it - no fuses or anything - first - I assume that one has measured that there is actually voltage coming out of the charger? Unless C804, 470uF, on the output of Z53, a 7530 voltage regulator, has decided to go short-circuit, which would be most odd! As I don't know where to find those components - except adjacent to the microprocessor - I would be tempted to leave the charger switched on for a day or so - possibly checking that voltage is coming out of the DC Input Socket, and onto the board - and then hit the reset again.
I'm sorry - you have my sympathy - just can't see any other reason why!
Bob.

Sorry to hear about your dead 1103.

I own the close cousin to the 1103. With exactly the same circuits Eton E5.

I think that these units can sometimes be strangly affected by changes in power situations. I know the unit I bought new was from several years ago and had no power applied to it. When I put batteries into it it simply locked up and did not power on. Even the reset wasn't working at first. However after I left the batts in for several hours and then tried a reset it powered on!!!!! SOunds like a finicky capacitor or microprocessor to me! I also noted that for the first few times of the batts draining to auto shut off that I would have to reset the unit to unlock the CPU. However after several times of using the batteries and having them drain and auto shutoff the unit now behaves as it is supposed to.

LEAVE the fresh batteries in the unit overnight!!!!! Then try a reset!

Hello

I have build at Preselector for the DE1103, and as almost any wideband reciever it does it good. I can recomend using such a thing when one is listning on shortwave. It reduce overload problems and a lot of noise.

I have made a folder under FILES

The folder name is Preselector and there you will find a description of the project.

Best regards

Max

Well, I've tried the suggestions and no joy - its def. dead! I also took the back off just for a peek - very tidy in the unit I must say, but no disconnected wires and no obvious burnt out areas or capacitors.

Oh well, off to ebay it will go - perfect condition, box, etc. so hopefully I'll raise some of the funds to replace it. This hasnt put me off the DE1103, just need to put it in hand luggage rather than trust a shipping company!

Thanks to everyone who's come up with ideas.

2320. DE1103 Reduced Audio Using Narrow Filter

Yahoo group: de1103
Date: 2009-09-12 01:27:35 UTC
From: hassenfritz
Topic: 2320 Message: 2320

I just recently purchased a Degen DE1103 and have noticed that sometimes when I switch in the narrow filter the audio goes almost silent. If a signal is in the passband it becomes almost impossible to hear. Turning up the volume does little good. This condition is with the whip antenna. I haven't tried an external antenna with the set to date. Has anyone else experienced this problem? Is it an alignment issue or what is causing it?

Thanks in advance!
Steve Hassenfritz

From: martin
Topic: 2320 Message: 2321

Hi. Steve. I do not have any such problem with my Kaito KA1103. All that happens when I switch from wide to narrow filter setting is that the audio loses some of its higher frequency components.

Sounds like you have a problem, possibly with the filter, or the alignment of the radio. You might try tuning up or down 1 or 2 Khz and see if that helps.

Dear Steve:

That shouldn't happen. Try a reset, and if that fails, I would suggest returning the unit, should that be a cost effective solution. If not, and you happen to have an old style audio equalizer, you could run the 1103 output through the equalizer and roll off the high frequencies.

I listen to a lot of am dx, and have decided to purchase an outboard audio dsp filter and a second passive tuned loop to clean up some of the heterodynes, hash from all of the ethernet boxes in the neighborhood and null some of the stronger pest stations. The 1103, IMHO, is an excellent base platform for many applications.

My 1103 has recently died so I opened the case. The circuit board has 1103- MKIV on it.
Presumably that makes it a Mark 4 for what that is worth.

Hello World!

This discussion of DE1103 serial numbers and production dates has been very interesting.

So I examined my box, but found no date information.

Interesting enough is that although I bought my receiver this summer, the serial number is so low, A015058! Perhaps the Chinese eBay seller has had old stock receivers, or the numbers really are of no importance here?

The receiver was undoubtedly nonused and in perfect condition.

I have 3 SONYs and one TEN-TEC RX340 plus 10 other receivers, but this is more modern technique and therefore a real small wonder, to say the least!

I have no doubts any more, why both GRUNDIG and SONY have thrown the towel... The Chinese win hands down!

Congratulations to all happy DE1103-owners!

Aimo

After trying everything I gave up on the Degen. I left it on the shelf with no batteries in for a month. Yesterday I put a set of batteries in and it came on. The buttons weren't responding but the radio started playing. I couldn't get it to switch off so I took the batteries out and then put it in again. I did a couple of resets and it improved but still worked erratically. Left it overnight with the batteries in and now it appears to be working ok. Don't know how long it will stay like that but it is ok now.

Hello Ian..

Glad to hear your 1103 has decided to mysteriously return to life....

Your experience sounds quite familiar. Perhaps the microprocessor develops a fault or glitch and even the reset can't rectify it because there is still a small charge in the capacitors. Then when it sat for the month and all the juice drained out the thing was able to do a complete reset properly. The general rule has applied for some time regarding basic microprocessor technology. Always drain all the elelctrical charge out of the unit (including the capacitors) and then see if it will reset.

Bill

These radios seem a little temperamental. I had mine running on the AC adapter (w/o batteries in it) and then when I installed the batteries it would not turn on. I let it sit for a couple of days and installed the batteries after charging them outside the radio and it works again... :) I believe that your comment about letting it stand for awhile until all charge has drained is what allows the uC to be reset and made operable again.

Cheers!
SteveH

2329. 12 hours clock format

Yahoo group: de1103
Date: 2009-10-12 03:23:47 UTC
From: knyuen88
Topic: 2329 Message: 2329

How to reset the clock format from 24 hours to 12 hours format?
Thanks in advance.

2330. Unmuting the 1103.

Yahoo group: de1103

From: bobyorston
Topic: 2330 Message: 2330

Hi All - When doing a manual scan - by gradually rotating the tuning knob, the set is not muted on AM or FM, but when doing an automatic scan, by pressing BAND- or BAND+, the set is muted on both AM and FM - as a result, you don't know what you are missing! As far as I can tell, this function happens inside the TA2057N, although it can possibly be controlled by the TA2057N pin 9. Has anyone any suggestions? (Maybe there is a mod that I've missed!)
Forever hopeful,
Bob, VK2CAN.

2331. Re: [de1103] Unmuting the 1103.

Yahoo group: de1103

From: Bob Yorston
Topic: 2330 Message: 2331

On further investigation, maybe this can be accomplished by shorting out R213, on the base of Q16 - has anyone been there? I couldn't find detailed instructions to get to the back of that board, although I have a photo showing the locations of Q16 and R213. If shorting out R213 to keep Q16 doesn't solve the problem - i.e. it then mutes all the time, then shorting Q16 C-E should do it!
Bob, VK2CAN.

Looking closer at the circuit, maybe the same thing can be done by connecting 100K from TA2057N pin 9 to either pin 6 (VCC) or pin 8 (GND). This would only involve taking the back off the set, or am I completely on the wrong track in regard to the operation of that part of the TA2057N?
Bob.
P.S. Maybe the entire subject is too profound - I don't seem to be getting any feedback!

The Degen has lasted 4 days this time and has now died again. Same symptoms. Will not respond to any buttons or the jog wheel and will not power on. Resets make no difference. Batteries are now out again and I will try it again after a week or two. I am losing faith in this radio. I really like it when it is working but I cannot rely on it to stay working.

Ian:

Since the unit is now dead once again lets try an experiment...removing the batteries and AC so there is no external juice going to the unit insert a paper clip into the reset access and hold it down for about 5 seconds Then reinsert the paper cliip and depress the reset button once again. Then reinsert batts into the unit. Anything now? Get back to us.

Bill

Topic: 2311 Message: 2335

The Degen has come good again of its own accord. I left it for about a week without the batteries then put them back in this morning. Lo and behold it started working again. It still had all the stored stations but had lost the time. Next time it fails I will try your remedy and see what happens. I have lost all faith in this radio's reliability and am sure it will fail again soon.

Thanks
Ian

2336. Problem with new DE1103, continuous tone across AM band

Yahoo group: de1103
Date: 2009-10-18 20:09:11 UTC
From: pennine56
Topic: 2336 Message: 2336

Hello

I wonder if anyone has come across ths problem and possible solution.

I bought a new Degen DE1103 from a well regarded Hong Kong supplier via eBay (I live in UK).

Serial number in battery compartment AI 102516

It worked fine for the first day but now has a loud continuous whistle type tone across the entire AM band when not in SSB with built in aerial. This gets louder at some frequencies but there all the time. Reset has no effect and no electrical items in my house causing it as other shortwave radios both analogue and synthesized don't show it.

I'd estimate the tone frequency to be about 500 - 1000 Hz

Two sets of brand new batteries tried and also on mains.

I'm an electronics engineer so can fix eg dry joints loose connections if know where to look.

Neither the seller or Degen support on website have replied to my query after a week. In principle a 1 yr guarantee but sending back to seller would cost half the radio's value so would rather fix myself if possible.

Thanks for any insight and for your time.

with regards
Ian Walker
UK

Bill

The degen died again so I tried your remedy. When I put the batteries back in, it would power on with the volume at 40 but would not respond to any buttons. You couldn't change the volume, station or anything. The time would change sometimes but not often. I then did a reset with batteries in and it would no longer work. Pressing the power on made the time blink but you couldn't change the time nor would it power on. I have repeated the treatment with long resets while the batteries are out but it is still the same. I will give it another rest however I am pessimistic - I don't think this radio will ever be completely right again. Chinese quality still has a way to go or at least this example of a Degen does.

Ian

2338. Re: Problem with new DE1103, continuous tone across AM band

Yahoo group: de1103
Date: 2009-10-20 02:16:37 UTC
From: knyuen88
Topic: 2336 Message: 2338

Why not take the DE1103 outside (preferably miles away from home) and see if it is the radio's internal problem or due to external interferences somewhere arround your neighborhood.
On the otherhand replace the betteries will known brand new ones and see if the batteries are the cause.
Furthermore will the whistles disappear:
1. When using the ear phone instead of the speaker?
2. Hooked up the line output to an external amphifier?

Hope it helps.

Hello,
It seems that your SSB BFO (beat oscillator for SSB demodulation) is runing even if you do not turn it on.
As it operates in 455kHz and may cause interferences like you informed. It is only a insight.

Good Luck.
Julio.

I bought a new Degen DE1103 from a well regarded Hong Kong supplier via eBay (I live in UK).

Serial number in battery compartment AI 102516

It worked fine for the first day but now has a loud continuous whistle type tone across the entire AM band when not in SSB with built in aerial. This gets louder at some frequencies but there all the time. Reset has no effect and no electrical items in my house causing it as other shortwave radios both analogue and synthesized don't show it.

I'd estimate the tone frequency to be about 500 - 1000 Hz

Two sets of brand new batteries tried and also on mains.

I'm an electronics engineer so can fix eg dry joints loose connections if know where to look.

Neither the seller or Degen support on website have replied to my query after a week. In principle a 1 yr guarantee but sending ba ck to seller would cost half the radio's value so would rather fix myself if possible.

Thanks for any insight and for your time.

with regards
Ian Walker
UK

Hello,
Do you have some instrumentation like multimeter, osciloscope or frequecy counter?

Should be importat to check the voltages, wave forms, leakages of capacitors, devidation of values of components, following the schematic, in the followings points:
-CPU Xtal clock oscillator (X801)
-Main voltages +B
-Voltages around the dc/dc converter (T401 / D7 - zener 12V)
-Output Voltages of voltage regulators
-Voltage on + pins of ICs

Another constant source of problems are the electrolytic capacitors, if possible test all them.

The ceramic capacitors around the CPU Xtal clock oscillator (C801 / 802) or even the Xtal clock (X801) could be the problem also.

I have my DE1103 for 1 month, luckily it works fine (so far).

Good Luck.
Julio.

Em 12/10/2009 09:09, ian.campbell99 < ian.campbell99@... > escreveu:

The Degen has lasted 4 days this time and has now died again. Same symptoms. Will not respond to any buttons or the jog wheel and will not power on. Resets make no difference. Batteries are now out again and I will try it again after a week or two. I am losing faith in this radio. I really like it when it is working but I cannot rely on it to stay working.

> Your experience sounds quite familiar. Perhaps the microprocessor develops a fault or glitch and even the reset can't rectify it because there is still a small charge in the capacitors. Then when it sat for the month and all the juice drained out the thing was able to do a complete reset properly. The general rule has applied for some time regarding basic microprocessor technology. Always drain all the elelctrical charge out of the unit (including the capacitors) and then see if it will reset.

When I put batteries into it it simply locked up and did not power on. Even the reset wasn't working at first. However after I left the batts in for several hours and then tried a reset it powered on!!!!! SOunds like a finicky capacitor or microprocessor to me! I also noted that for the first few times of the batts draining to auto shut off that I would have to reset the unit to unlock the CPU. However after several times of using the batteries and having them drain and auto shutoff the unit now behaves as it is supposed to.

From: pennine56
Topic: 2336 Message: 2341

Hello

Many thanks for the suggestions. After exploring further I find:

- the tone is also on earphones and line out
- the tone doesn't seem to be SSB always on, although when switch on the SSB, instead of the usual SSB tone there is a complex warbling and can't be set to zero beat
- turning off any likely electrical item in house doesn't affect it

My suspicion is that there's some sort of unwanted local oscillation occurring somewhere in the circuits.

If the ribbon cable was longer I could probably try running when split open and probing with an insulator to try and see if any localised problem eg dry joint, failing component etc.

I have had the radio fully open and inspected boards under strong lens and nothing obvious although the quality of some of the soldering in this example looks poorly done, so maybe a partial short circuit somewhere could be a cause.

regards
Ian

Since the de1103 worked fine the first day, another possibility is when u tried to learn different operation procedure/options u may mess-up the CPU functions. Try RESET (or even removing the batteries from the set) before starting other time consumptive trouble shootings afterwords.
Again have you tried testing the set miles away from home ?

Hi

Unfortunately reset didn't have any effect when tried a few times over some days.

I did try switching off electrics off in house but tone still there. Other shortwave radios owned both analogue and synthesized don't seem to suffer from it.

If the Degen is super sensitive to some local interference that other SW radios aren't, unfortunately it won't be much use to me. I live in fairly typical housing estate with no very near industry so don't think there's anything out of the usual in the area.

Thanks for the help and suggestions.

regards
Ian

Hi Julio

Thanks for the advice. I don't have the necessary skills to do testing to the level you suggest. Currently the radio is working after trying Bill's treatment of 5 second reset with no batteries followed by another reset. I remain sceptical as to whether it will continue working.

Ian

Even if other GOOD shortwave receivers shown no such symptoms but due to circuit differences DE1103 may behave differently.
Sure it cannot rule out the problem(s) is due to defected components inside. Yet hope for the best it can either be an external interference problem or u did mess up those CPU command sequences.
In short, suggest try whatever approaches before taking the set apart for trouble shootings. Working against those SMC-surface mount components-- even with sophisticated equipments and expertise are definitively not worth the efforts.

2346. Buying Degen 1103 in China

Yahoo group: de1103
Date: 2009-10-25 09:22:08 UTC
From: ptchoon
Topic: 2346 Message: 2346

Hello friends,

I've been lurking here for a while, and I'm pretty impressed with the Degen 1103 and other Degen radios.

However, what I know of these Degen radios has been from what I've read here and elsewhere on the internet, as there is no easy way to purchase a Degen where I am located.

I will be travelling to southwestern China (Nanning and Guilin) soon, and am wondering if any of you have managed to buy Degen radios when travelling in China? What type of shops sell these radios, if any? (I won't be travelling to Shenzhen, where these radios are made).

I do have several other radios currently, like the FRG7700, IC725, IC726, FT747, Pro2004,Pro2006 and many others. Some radios which I've owned before were the RA17, CR150, AR88, ICF6700 (not the 6800 though), ICF2001, TS440, TS940, IC765, R8, and a number of others.

Would like something that is small and works well, and the Degen 1103 seems like a good fit for me. My previous ICF2001 was a bit bulky for me when travelling, and its performance wasn't really up to my requirements.

Thanks and warm regards!

A friend of mine managed to buy one when on holiday in China, but I think he
had to use mail order as he couldn't find one in a local shop.

I would also try to deenergize all the caps (and MPU) in the radio by removing batts and AC THEN depress the RESET button twice. Leave the radio off for at least 24 hrs, again press RESET then reinstall fresh batteries.

Tell us what happens.

Good luck.

It appears that the Degen/Eton radios do have fussy microprocessors.

Bill

Hi

Thanks for procedure, I'll try it.

In case of interest I've uploaded a 35 sec wav file sound clip (3 Mbyte) from the radio's headphone output to link below.

http://www.microscopy-uk.org.uk/degen/degen.wav

It's the audio heard when slowly tuning middle of the 19m band with telescopic aerial extended. The tone occurs short frequencies apart. Between 25 - 34 sec of clip the SSB is turned on to show the unusual warble while trying to unsuccessfully zero beat it.

This tone is on MW and SW bands, FM is OK. The tone pretty much blocks any stations.

regards
David

Did not sound like audio feed back/oscillations inside the DE1103.
Again did you try take the DE1103 "far far away"/miles away from home -- as to confirm it is due to external HF interference? (at least the noises may change tones -- or other tell-tale characters.)
According to Murphy's law: ...anything that can go wrong will go wrong. (your neighborhood interference source(s) activated only after you got this set !)

erm, if you mean below 70kHz, it's possible. There should be a document in the files section of the group that explains how to do it.

2353. Degen de 1103 below 76 MHz not Khz.

Yahoo group: de1103
Date: 2009-10-29 09:20:08 UTC
From: Mike
Topic: 2353 Message: 2353

Ok I have seen the files on tuning above 29.999 in KHZ but I did say the guy on YOU TUBE was showing a tune DOWN below 76 MHz, you see him tuned to 77 mhz and a rusian station is heard he stays on there for a while, there is no further tune down, the VID starts once more and he is around 63 MHz. I still think its a fake, unless there is an explaination.

2354. Re: [de1103] Degen de 1103 below 76 MHz not Khz.

Date: 2009-10-29 09:57:08 UTC
From: Ewan Meadows
Topic: 2353 Message: 2354

For the second time, it's not fake:
From http://groups.yahoo.com/group/de1103/files/
DEGEN DE1103-modifications.pdf<http://f1.grp.yahoofs.com/v1/kFnpSsHwN_D3k_g2g8ZV-W6sRM_wQKZRP3X0KeqHfhW1SpbQZFVJ4_wAif7Eitfce0A72trqkJFUijMQh-f5WFktJi3lMKIA/DEGEN%20DE1103-modifications.pdf>

"We show you how to receive signals below 100 kHz and above 30 MHz
Interesting information about possibility of the DE1103 receiver to receive signals below
100 kHz circulated on the Internet. The discussion centered on this, and on our pages (
moreover, the method to receive signals above 30MHz was found separately by forum
member luv). The receiver designers designed a hidden capability into their creation,
whose secret was quickly found because of the world wide web. The pleasant side of this
modification is the you only need to use the receiver’s keyboard, without requiring any
disassembly. The method to obtain an extended range on the DE1103 is interesting by
itself, and leads us to believe that this was probably implemented by the engineers as a
joke, to allow to widen the DE1103 reception range. Many receiver owners among the
site have successfully extended the range of their receivers.
The instructions on how to extend the frequency range below 100 kHz is given below.
1. Turn the receiver ON and tune it to frequency 21951 kHz by typing it on the digital
keyboard (2-1-9-5-1- "BAND+").
2. Simultaneously press two buttons: "BAND -" and "BAND+" before the beginning to
scan downward in frequency.
3. Wait for the approximation of the current scanning frequency to lower boundary of
100 kHz frequency (this is engaged itself decent time). Do not touch the tuning knob
during all this time – touching it will stop scanning and it will be necessary to repeat the
procedure anew. When scanning reaches the lower boundary of 100 kHz and passes it, be
attentive. You now need to stop scanning by pushing any button or by turning with the
knob. The frequency indication below 100 kHz will be three-digit, for

example, for 50
kHz:
4. Store this frequency or any other below 100kHz into memory: push the
"STORE"
button, select the storage address with the tuning knob, release it and once
again press
"STORE". It is better to use an address at the beginning of the bank - this
is more
convenient for future selection. Attention: to choose the stored frequency
(to be tuned to
it) you only need to choose the tuning knob.
To extend the tuning range above 30 MHz do the following:
1. Turn on the receiver and tune it to frequency 21951 kHz by typing it on
the digital
keyboard (2-1-9-5-1- "BAND+").
2. Simultaneously press two buttons: "BAND -" and "BAND+" at the moment of
beginning a downward frequency scan.
3. You will stop scanning by pushing any knob, then press the "BAND+" button
and keep
it pressed prior to beginning an upward frequency scan.
4. Wait to reach a frequency above 29950 kHz and stop scanning. Store the
frequency
stopped at into any storage cell.
5. Recall the stored frequency by pressing the "M/F" button and go into
manual tuning
mode by repeatedly pushing this knob. On the display there will be the
frequency stored
earlier, and the “MEM” inscription on the right side of the display will be
replaced on
"VOL".
6. You will not scan upward in frequency by pressing and by keeping the
“BAND+”
button pressed. Scanning will pass the 30 MHz frequency (the display will
indicate the
form "b0000", where the first symbol – is the inverted letter B). Attention:
you will have
to stop scanning when the indication is between “b0001” and “b0009”
(30.001-30.009
MHz).
Now it is possible to tune the receiver with the tuning knob. The main thing
is to have
time to stop scanning in the space indicated, and then use the knob to
receive frequencies
above "B00y0". If we do not do this and do not stop scanning, then
immediately after the
frequency "b00y0" (30.010 MHz) the receiver goes to the FM band. You will
have to
repeat the steps above from the beginning to receive frequencies above
30MHz.
7. Now it is possible to tune above 30MHz with the tuning knob. The main

thing is to
have time to stop scanning before the frequency reaches “b0009”, store it into memory,
and the afterward you can dial in frequencies above “B0010” with the tuning the knob.
Now your DE1103 can receive below 100 kHz and above 30 MHz. But tuning for these
frequencies differs from the usual DE1103 tuning methods. The frequencies of the
extended range cannot be received by direct keyboard entry. You also cannot go to the
extended ranges by pushing the “BAND-“ or “BAND+” buttons. You can only use the
previously memorized frequencies with any "opened" frequency below 100 kHz or above
30.010 MHz and by pushing of the "M/F" knob to pass into the manual tuning mode. By
turning the knob or by starting a scan it is possible to reach the desired frequency, but if
the difference between the start frequency in the memory and the tuning frequency is
great, you will have to wait a considerable time to reach it. Therefore, I recommend to
store several "round" frequencies into the receiver memory (for example B0000 ","
B1000 "," B2000 "...) for convenience and speed of future tuning.
Is the extended range generally necessary in the DE1103? Each DE1103 owner can
answer that for himself. In populated area at frequencies above 30 MHz, it is possible to
hear everyday radiotelephones, which work with narrow-band CHM. With the small
detuning it is possible to legibly take this modulation form in AM mode. In outlying
regions were preserved the "national-economic" transmitters in the 33-38 MHz band,
which also use narrow CHM.
Below 100 kHz you can actually hear, perhaps, only one "site" - the standard time signals
station at frequency 66, (6) kHz for this it is necessary to connect external antenna into
the antenna jack.
Randomly it was possible to reveal that after conducting the extended frequency
procedure, at 100 kHz it is possible to select the type antenna used at frequencies up to
1710 kHz - internal ferrite or whip antenna.
Originally in the factory version, when tuning below 1710 kHz the ferrite antenna is
always connected, the whip antenna in this case is disconnected. The same

rule remains
in "the opened" DE1103 when tuning frequencies under 1710 kHz in the usual manner
(straight frequency recall from memory or using the range change buttons). But if we
"enter" the extended frequency below the 100 kHz range via the memory recall at the
"low" frequency, then going into manual tuning by repeatedly pushing the "M/F" knob,
as it was described above, this tuning method will use the whip antenna. Then by tuning
using the knob to raise the frequency, the whip antenna remains connected. However, the
radio goes back to the ferrite antenna when you tune at frequencies below 1710kHz using
the normal method (by recalling memory or by changing the range.
I note that in the "old" DE1103 when the ferrite antenna is connected (at frequencies
below 1710 kHz) at any moment it is possible to switch to the external antenna by simply
inserting in the antenna jack. Also it is possible to enter also in the "new" DE1103 with
the antenna jack. But to here in the incomplete plant receiver of new version use external
antenna below 1710 kHz will not come out. Only after extending the range below 100
kHz in the "new" DE1103 appears the possibility of replacing the ferrite antenna with the
whip antenna using method described above, and only then it is possible to pick up
signals upon the external antenna, connected into the jack instead of the whip. As we see,
connecting the external LW/MW antenna is more complex in practice, to say nothing of
the deliberately sad behaviour of the "new" factory DE1103 with the external antenna."

From: Mike
Topic: 2358 Message: 2358

Hi ALL. It would seem I keep being told to go to the file relating to the DE 1103 tuning up from 29.999 KHZ note Kilo Hertzs in "AM" but not being directed to the mode that makes this radio tune up from 35 MHZ note Megga Hertzs to 76 MHZ and or down from same IN FM this is what is wanted. Some of the files are coming up as blank a page! I have seen the RUssian translation now 5 times IT IS NOT WHAT IS WANTED, as that is the AM mode eg putting in 21950 or there abouts. I would like this radio to tune in FM from about 35 mhz up to 76 mhz and NO OTHER frequecy range, is this mode on your file that can be opened please place an active link if if is. THANK YOU. Mike - UK-

2359. Tuning DE1103 below 76MHz may actually not be possible. (was Re: Wrong Info)

Yahoo group: de1103

From: silva_halide
Topic: 2358 Message: 2359

Hi Mike,
I have just read the entire pdf document titled "DEGEN DE1103-modifications.pdf" in the Files <http://groups.yahoo.com/group/de1103/files> download area. (specific file location hyperlinks can't be copied from Yahoo groups as they are session dependent).

I'm sorry to say that it has the following information on page 25 which tells me that these Russian gurus of the DE1103 know of no way to tune the radio below 76MHz.
"Other Information

Here answers to some questions from our considerations DE1103 on the forum.

Extending the FM range below 76 MHz is not known today."
The article does explain how to tune above 30MHz in the FM band (on page 17), but how far above is not explicitly mentioned. They imply 38MHz is possible, but nothing higher. Try it out and let us know exactly how high you can get to !

"In populated area at frequencies above 30 MHz, it is possible to hear everyday radiotelephones, which work with narrow-band CHM. With the small
detuning it is possible to legibly take this modulation form in AM mode. In outlying regions were preserved the "national-economic" transmitters in the 33-38 MHz band, which also use narrow CHM. "

Hi Mike and all,

AFAIK, tuning the 1103 in the OIRT FM band is only possible if your set displays a dot instead of some memory cell number. This way of tuning, indeed, is nothing to do with tuning up from 29,999 kHz.

Most Degens (including mine) display all 256 memories normally, and therefore cannot be forced to receive signals below 76 MHz.

73,
Dmitry
Russia

Hi Bill

I have tried that reset technique more than once but unfortunately makes no difference to tone heard. Although on my example not sure if it is doing a full reset, as noticed it still remembered Radio 5 (UK) 1089 kHz when first went into MW which was the last station I was on.

Have also confirmed it's not local interference. I'm almost certain it's a fault but as folk remarked, fault finding on these is beyond what I could do at home despite an electronics background. The short ribbon cable doesn't allow checking while on either.

I did notice the tone isn't always there initially but gets much worse after few minutes switched on, perhaps some half working component going off spec.

Put it back in its box pending inspiration or may see if it has finite value for spares / repair on UK eBay.

regards
Ian

Hello,
You can watch this video here:

http://www.youtube.com/watch?v=Y4QTEyM13Ds

And here are the comments of author:

"101.2
100.4
100.0
99.40
91.40
90.80
90.20
88.30
88.00 Svezhiy Veter, Pervouralsk
83.75 TV sound
77.25 TV video
72.83 Kanal Voskresenie
71.84 Radio Mayak

HOW TO:
Sometimes in some receivers (as a result of accidental bug or during the power reset) in memory cell the DOT emerges (instead of the cell number).
It's unpredictable bug or fault.
Only in some pieces.

- Dot
- Then to press "M/F" and begin manual scanning with wheel for a long time till "B72.90" (very very long time for "72.90") or something similar.
- To store this frequency."

Regards.

From: Mike
Topic: 2218 Message: 2371

Hi Peter. I am in no way a teche and so I ask, What happens if you mess up the 1103 with this long scan in the worst senrio the radio will not get back to its factory setting, to me its frightening, is anyone else thinking along the same lines.
A bit off subject I have a Yaesu Handy for 2 mts the 727, I recall someone telling me to put in some numbers cannot recall what it was lets say 31.000 with this the radio tuned from 139-148 but in 50 khz steps and not 12.5 khz it took me a hell of a while to get it back to tuning 143-148 at 12.5 khz steps, can I therefore presum that the same type of numbers trick will work on the DE 1103 and that you can get back to factory settings, if you mess up.
PS I read this OUT LOAD and it read fine by me, but then again I am a bit dislecsic {sorry if even that word is spelt wrong} People come for all walks of life. Mike.

Hi Fred. The complete unedited file is available from the Prime Time Shortwave web site. It is the "frequency large" version, meaning that it is sorted by frequency, and is quite large (24+ pages) The utilities station info at the end of my edited file was added from a couple of other sources.

2381. EARTH OR NO EARTH?

Yahoo group: de1103
Date: 2009-11-23 10:05:26 UTC
From: bobyorston
Topic: 2381 Message: 2381

Hi All - Just a thought - for the many instances when a decent earth is not available and/or not convenient, how about putting a small, high voltage capacitor - say 1000pF, 1KV - in the plug-pack - from what should be neutral to the negative output terminal? I guess the electrical experts will frown on the idea, but it might be better than no earth in some circumstances!
Bob.

Highly suspect you will pick up lots of power line noises rather than making the reception better.

> Bob.

I do not think that a ground is required for the 1103. I have found that the easiest way to reduce or remove noise is to run the unit on freshly charged batteries (NiMh) and operate it outdoors, away from power lines, computers, motors, etc. I've thought about using a helium balloon and putting up a full wavelength wire antenna for a shortwave band-on a clear evening with no threat of thunderstorms, of course, and with the antenna wire "grounded" through three one megohm resistors to drain away static charges.

It would be interesting to take a 1103 with fresh batteries to the parking lot at the top of Pike's Peak in Colorado to see just how good the FM and AM sections really are with an unobstructed view.

Using a passive, tunable external loop antenna the radio shines on AM. I have hopes of trying to improve nulls by using a second tuned loop-we have an in-town AM station that bleeds over most of the band. I plan to add a trimmer capacitor to my second tuned passive loop for a bit of finer control.

Ian - I was going to bid on it but forgot 8-[so before you bin it, any chance you could get in
there with an oscilloscope and try to see what's going on?

What I'd like to ask is - does this tone vary with the receive frequency from one end of the band to
the other, for example from 1 - 20MHz? I assume the tone is _really_ there, coming through the IF
stages and detector, in which case the first suspicion probably falls on the Local Oscillator PLL

The LC72137 datasheet http://www.datasheetarchive.com/pdf/Datasheet-06/DSA0093184.pdf shows how the
PLL frequency synthesiser IC is used and shows the pinouts. The tuning voltage is output from pin 18
and is available at either end of R403, so start by looking there, with the 'scope at maximum
sensitvity and ac coupling, or maybe even listen with an amplifier for any sign of the tone. If
there is any instability in the loop, it should be possible to cure it, maybe by changing values for
C403 or R401. If there is no sign there, maybe you can chase the tone back through the AF stages and
the demodulators - but that's something to think about another time!

I feel it as a batch failure and can be tried with replacement of power line decoupling capacitors. A laborious process no doubt.
again a case of false SSB switching with no user control could be possible, but then, the SSB fine control knob should have some effect.

2390. Bad problem with FM reception

Yahoo group: de1103
Date: 2009-12-10 07:15:45 UTC
From: Bob - K2KI
Topic: 2390 Message: 2390

Hi everybody,

I just recently received a DE-1103 for my birthday. I got it on ePay from an Asian firm Anon-Co.

First off, the audio on every band is "rough" around the edges. This is regardless of signal strength and settings.

But the main problem is with the FM band. All stations received sound clearer at least 60 KHz low in frequency and the stereo decoder had significant problems when tuned this far from the center of the signal. When tuned to the correct frequency, there is more carrier than audio and the audio is very rough. Even when I detune down in freq, the audio sounds better but not great.

Has anyone experienced this problem before?

I hate to send it back as it will cost me more than what I paid for it. Any ideas what I should/can do?

I look forward to hearing from anybody.

Thanks...
Bob de k2ki

From: Julian Hardstone
Topic: 2390 Message: 2391

Bob - That's rather disappointing, as the 1103 is noted for its very clean audio, especially when
you use stereo headphones on FM

I wonder what volume level you are using - you probably found the 1103 turns on at maximum volume
the first time you turn it on. I find a setting of 12 - 15 gives a good clean level with the
supplied earphones

If FM is distorted until you tune off-channel, this could point to incorrect alignment of the FM
discriminator coil T202, but first, check that the frequency calibration is correct on the SW bands.
Find a known station and check that the frequency display is correct, using the 'narrow' bandwidth
setting. If not, you probably need to adjust the reference oscillator, which is set by TC1

If you take the back off, you can easily get at TC1 & T202. Tune TC1 for correct frequency display
as above. If you are happy with that, adjust T202 on FM. Tune to the correct frequency for a
moderately strong FM station. Mark the original position of the core, use a well-fitting screwdriver
and listen to the audio quality as you turn the core up to ? turn either way. When you have minimum
distortion you will find the tuning is fairly symmetrical about the nominal frequency. I presume you
mean you have to tune 50kHz off, as the 1103 tunes FM in 25kHz steps

HTH - Julian

Hi Julian,

Thanks for the reply.

Yes, it is rather disappointing indeed. I too was sold on the DE1103
because of the reviews I read about the quality of the audio.

I agree, the alignment does seem off. The SW and AM bands are dead on. I
calibrated to WWV, CHU plus a few other known sources.
>
>

I wish I didn't have to take the back off because I would be voiding the
warranty. But, with that said, as I stated in my original message, it
would cost me more than what I paid for the radio to ship it both ways.
I was hoping that the radio was merely set to another standard and the
problem could be solved with a few "hidden" key strokes.

>
The tuning on the FM band appears to be as you say in 25 KHz steps. I deduced the 60 KHz because if I tune down 50 KHz the audio quality appears to improve but if I go to 75 KHz it is worst but not as bad as if I tuned only 25 KHz. This led me to believe that I was tuning past the "sweet" spot. But, it might be just the discriminator being off-aligned and if that were the case. I would just be fooling my self in thinking otherwise.

Thanks for the help. I will search for a parts placement layout for this radio.

From: Bob - K2KI
Topic: 2390 Message: 2394

Hi Julian,

T202 worked like a charm. I now am receiving stations well. One think I noted though...
If I tune from low in the band to high and encounter a station, the receiver captures almost immediately within 25 KHz of acquiring signal .

If I continue to tune through the station, I find that I am able to still hear the station well past 100 KHz with dips in signal strength and the audio is very muddy and raspy. If a weak station is within this range, it is lost. It almost seems like I am encountering the midpoint of the first station on the low edge of the IF skirt. Does that make any sense.

If I tune high to low, the signal of the stronger station is encountered 100 KHz from the desired freq and fully captures at the desired freq. If I tune lower, I lose the station completely 25 KHz from the desired freq. So, the same results are noticed.

Your input is appreciated.

Thanks for your help.

From: Horacio Nigro
Topic: 2390 Message: 2396

With the new DSP receivers (Tecsun PL380, Grundig G8, D96L, etc.) a great FM reception has been accomplished with variable selectivity . I performed the filters change (a senior technician made it for me), 80+110 but it was too much narrow, and had to make a step back with 110+110. In Europe, for real DX this and the other filter configuration gives much more selectivity but fidelity is compromised.

From: bobyorston
Topic: 2397 Message: 2397

Hi All -
I have had an early DE1103 which went from 0MHz to 40MHz, and still does.
However, a newer DE1103 I can only get to function from 0MHz to 30MHz.
Am I doing something stupid (maybe Alzheimer's has crept up in the past few years!) or has there been some change?
For that matter, has anyone got clear, precise (English) instructions for 30-40MHz - maybe I just fluked it before.
I can get d0,000KHz in memory, but when I pull it out and start manually tuning, it goes straight to FM!
Regards,
Bob.

IC6 and IC7 are bonding IC, both are same.

IC6 is used for AM signal 1st IF amplification and AM signal 2nd IF composition.
IC7 is used for SSB signal demolulation.

Hello group

I have finished the Kiwa mods for the Degen this morning but when I turn it I hear just white noise on the SW,MW and LW but no signal.
While tuning there is a strong blip-blip sound.
However on FM the sound it is great . The front end FET is protected
with a diode, I have tried to reset it but nothing happens.

Do you think that I have burnt any transistor or the FET it is blown?

Any help would be greatly appreciated.

Thank you very much and happy Xmast.

Kind Regards.

While I too saw the comment that IC6 is amplifier.In fact, IC6 is converter from 2nd IF from with a carrier of 55.3945MHz, to take out the 450KHz 2nd IF frequency.
IC7 is SSB converter with 456KHz ceramic based SSB LO around Q19.
Both are similar chips. but unfortunately COB type. I was just thinking of a replacement for the COB.

While I too saw the comment that IC6 is amplifier.In fact, IC6 is converter from 2nd IF from with a carrier of 55.3945MHz, to take out the 450KHz 2nd IF frequency.
IC7 is SSB converter with 456KHz ceramic based SSB LO around Q19.
Both are similar chips. but unfortunately COB type. I was just thinking of a replacement for the COB.

2404. Re: [de1103] Problem with new DE1103, continuous tone across AM band

Yahoo group: de1103
Date: 2009-12-23 21:29:08 UTC
From: Moisés Knochen
Topic: 2336 Message: 2404

Today I remembered this thread after having virually the same problem with my DE-1103, purchased on april 2007.

After changing discharged batteries (NiMH) for a set of charged ones, the radio seemed to work fine for a while, but later when turning it on, the MW band was unusable due to a strong howl covering the whole MW band. I tried several resets with no result. Then took the batteries off compartment, waited a few seconds, put them in and turned the radio on again: it worked for just a few seconds but the howl returned. More resets, no result. Finally took the batteries of and waited for half an hour or so, put them again in the compartment and turned the radio on: the problem seemed now to be cured and the radio has worked fine for several hours.

So, this seems to confirm the theory that this kind of problems are caused by discharged batteries with too low voltage.

I hope the problem is over.

BTW Ian, have you sold your DE-1103? May be there is still hope for it!

Season's Greetings to all!

I guess the electrical experts will frown on the idea, but it might be better than no earth in some circumstances!
> Bob.
>

Hi all,

you need good earth for better (stronger) signal if you use telescope antenna for AM bands (or PA0RDT Mini Whip antenna), especially for LW and VLW bands. I use coax cable from Mini Whip and shield is grounded to 1,5meter long rod to wet earth. Some "rod" you need also for "portable" QTH.

You can test it simply:

set VLW band (below 100kHz) and some "time station", for instance 77.5kHz in Europe and use telescope antenna only!

if you hold fast receiver (or minus pole, shield or other "ground" of receiver) in your hand, signal is stronger than if you set receiver at table!

Best regards, Jara "Rat", Czechia, EU

While it may happen to help in some circumstances it will probably be noisy in many as well. A far cleaner (and safer) alterntive would be a counterpoise...a length of wire deployed along the floorboards.

Jay

From: kb8dns
Topic: 2407 Message: 2407

After a bit of a search I found and won a good example of a Degen DE1103 on an eBay auction. I joined the group to learn more of the radio and to share any interesting happenings. I have other receivers such as the SONY ICF-2010, Eton E5, Grundig G5 and G3, Uniden CR-2021 and the ICOM IC-746 with many different antennas.
Just getting used to the very different controls of the Degen but so far everything is straight forward. The memory layout is a bit different but I am coming to terms with it! I may upgrade the LED back light and the "kick stand" is missing.
The little receiver is doing very good and I shall post some more on what I find.

Hi Rod,
As you may have read in HFmonitors, I have pretty much assumed the E5, G5 and 1103 were pretty much equivalent, performance-wise. But since the 1103 is my only radio, I look forward to hearing your opinion.

George

Hi George. I have a G5 and a Ka1103. The performance is the same.
Not surprising since they use the same receiver board. Its only the
memories/keypad/displays that are different.

Hi George and Martin!

I am aware that the basic RF board is much the same in 1103 as it is in the G5, E5 and the G3. There are some subtle differences between the radios, most of them are to the good but at the same time make the radios different.
I have a hard time making a difference between the E5 and G5 as they are so much alike, if anything the E5 being an older radio does not have upgrades to it. The differences seem to be in the front end but yet does not seem to differ much in performance. I did replace the FET in the E5 with a MRF102 in a TO92 package.
The DE1103 could be described as a first generation and as such has some differences from either the E5 or G5. I think the receiver is a bit better on MW and LW and the radio over all performs similar on higher frequencies, that is on HF. I think the FM is a bit less on the DE1103 but it might be a narrow audio range. To me it seem a bit "squeaky" in sound quality, but other than that the FM works well.
Now the G3 is a much different animal as it is a different design, mainly the Silicon Industries Si4735 receiver chip which is basically the whole radio! The FM sounds much like the DE1103 but the big difference is the quiet receiver on MW and SW, sort of a DSP!
All three designs are very good radios and each has it's own good and bad points, over all I would say very good! I have two G5s and they are very close to each other but one seems a tad less noisy, less static floor. I was very surprised that all three Chinese radios come very close to the SONY ICF-2010 and beats the SONY ICF-7600 (not the GR). The G3 is a good replacement for the 2010 as it comes close to the performance of the SYNC and the price is just great!
SSB on the DE1103 is very good but a bit "shaky", I think the controls may be dusty as the VFO knob jumps as I tune it.
My "new" Degen DE1103 is in my collection and will be active in my listening post. I will make some more comparisons to other receivers and post some logs with the DE1103.

Hi Rod

I used the method of Site 1 in Silva's message and it worked. However I determined that there is a faster method if you have a couple of cups of coffee first:

1. Turn on the receiver and tune it to 29945 (2-9-5-4-5- «BAND+»).
2. Press simultaneously two buttons: «BAND-» and "BAND+" until the moment of the beginning of scanning downwards on frequency.
3. Stop scanning by pressing of any button, then press button "BAND+" and scan upwards a few seconds to 29980 (or just under 30000).
4. Hold down the store button and use the jog dial to select a Memory location, let go of the store button and hit it again to store into Memory.
5. Check that it is in memory scrolling up and down with the jog wheel.
6. At 29980 turn off the memory tuning mode. When you hold "BAND+" it will go up in increments of 5 kHz but it will switch to FM only "after" it reaches 30005. So press and hold down "BAND+" and when you think it is going to hit 30000 let go and press it again quickly. At least one out of four times you will probably get 30005 (the others being 29995, 30000, and FM). Store 30005 into Memory as above and you are all set.

It is a lot faster than scrolling up from 21951 kHz.

Also thanks for you comparisons of the G5, E5 and DE1103.

As far as the kick stand. You might email Tao Qu in Message 2400. He used to sell the DE1103 and parts for the DE1103 up until last month on Ebay (Store: Radio-and-Component) and he is almost sure to know how to do it.

Hi Rod,

I do not think I have spent more than 5 minutes total scanning above 30 MHz. I did not hear anything that I might ascribe to any form of data/voice communication. I also have not noticed any reports about reception above 30 Mhz on this forum (but then again there is not much about frequencies below 30 Mhz). This translation from from radioscanner.ru might indicate that scanning above 39 Mhz is a waste of time:

"In my copy of the receiver receiving the maximum frequency was 37.100 MHz. Above the breakdown occurred the synthesizer and the reception was stopped. Depending on the instance of the receiver (settings and parameters of the particular VCOs) borders receive stable after the "discovery" are in the range 33 ... 38 MHz, and the management synthesizer remains to 39.999 MHz ("B9999")."

But then again I need a translator for the translation.

I totally agree. If at all some one is interested , one could make a converter to bring any range to a spare laocation in the receiver working range.
that bring order and quality also to the signal , is what I feel.

2421. Brought my DE1103 off the grid!

Yahoo group: de1103
Date: 2010-01-21 08:35:37 UTC
From: kb8dns
Topic: 2421 Message: 2421

As I have done with my other receivers, I brought my 1103 off the grid to get away from all the "urban noise". As expected the radio was able to define more and fainter stations! Even the broadcast band was filled with stations and this was in the early afternoon!
With this test I am able to pinpoint two annoyances with the radio that I could not be too sure of. One is that the audio is a bit too bright although the wide narrow switch helps, I think a different cap placement might do the radio good. KIWA has a mod for this and I have seen it on a web page. Second is one I was not too sure of but it seems to me that the BFO is a bit aggressive when it is on. I hear a bit of noise that is best described as static or a "crunchy" sound along with the voices. It seems to be a bit "warbly" at the same time! I am not able to side step this with the filter or DX / LOC switch.
Any ideas on this would be welcome and I am hoping that it is just a simple pot adjustment! I am pleased with the DE1103, and as an early offering of the design along with the Eton and Grundigs, it is a good performer and has it's unique user interfaces like the dial and the memory slots.

Sorry you have such probs. You should share with us the name of the company
that does such a good job.

I bought it from Universal Radio. They seem to be a great company.

2425. BFO question

Yahoo group: de1103
Date: 2010-01-23 20:52:30 UTC
From: kb8dns
Topic: 2425 Message: 2425

I am really pleased with my DE1103 in just about every point, with one exception.... Using SSB the BFO seems to be a bit strong and distorts the signals I am listening to. The use of the DX / LOCAL switch helps but it should not do it at all.
Does anyone know of a mod for this? I am not sure of a level adjust is needed or maybe the change out of a coupling capacitor or maybe a buffer resistor.

Dear Rod:

It might be that your item was one of the early models that had a component or two value "off" in the audio amplifier chain. IF that is the case, Kiwa has a fix. IF you are handy with a soldering iron you can buy the kit and replace the capacitors yourself.

What volume setting are you using? To my hearing, the sound of SSB on the DE1103 sounds distorted if I listen higher than an 11, with a slight nod to "Spinal Tap". Try headphones and see if the speaker is the problem.

2429. LW beacon reports

Yahoo group: de1103
Date: 2010-01-27 12:25:24 UTC
From: kb8dns
Topic: 2429 Message: 2429

This morning, 12:00 UTC, I copied several beacons on the Long Wave frequencies of 200 to 400 kHz. They are aeronautical nondirectional beacons to mark airports. I was hearing several out of Ontario, Canada at distances from 180 to 310 miles from my QTH in Michigan's upper peninsula.
YXL - Souix Lookout, Ontario, Ca YLD - Chapleau, ON, Ca and QT - Thunder Bay, ON, Ca were among the ones I heard. Copy was from clear and loud to low and lots of noise (QRM). Most had lots of fading (QSB) but can be copied well over a period of time.
These beacons are modulated AM carrier and do not need a BFO to hear them. The Degen DE1103 picked these up with it's built in ferrite antenna and would be better with a loop coupling. Here is a link to a page with many LW NDBs....

2430. another DE-1103 bites the dust

Yahoo group: de1103
Date: 2010-01-28 00:32:06 UTC
From: Moises Knochen
Topic: 2430 Message: 2430

Yesterday one of my two DE-1103 died. The radio (purchased about 3 years ago on Ebay) developed a strong howling noise in all bands (even FM) making reception impossible.

This is not the first time it happened, in the previous time it could be fixed by taking the batteries out for a couple of hours and resetting the unit.

Now the problem returned, first rather intermittently, beginning in the higher bands (i.e. 19 m-band), but now the receiver is unusable. I tried resetting it several times, and also taking the batteries out for some time, without success.

Also I tried using alkaline AA cells instead of rechargeable ones, to no avail.

Currently the howling noise can be heard all across the MW band. On shortwave, the tone of the noise varies with the frequency selected, beginning with a kind of “motorboating” in lower frequencies and rising as the dial is set to higher frequencies. However in the beginning the noise was similar on all bands, being a high-pitched noise.

Interesting enough, this high-pitched noise was very similar to the kind of “blip” normally heard when one changes frequencies rapidly in this receiver. I have read (perhaps in the Russian website radioscanner.ru) that that “blip” is due to a poor design and not very clever selection of components (RC) in connection with the PLL which allows some limited oscillation to occur when changing frequencies, before the PLL settles down. I don’t know if there exists some relationship between the two things (such as the PLL going into a continuous oscillation). Anyhow today the tone varies with the frequency as explained before.

I think that one of the possible causes might be a component going out of specifications. But, what component? Given the complexity of the circuit it is not obvious.

Any suggestion would be welcome.

Meanwhile I will keep going the “magic” way, i.e. taking the batteries out, waiting, installing them again and resetting…

Regards,

Moises Knochen

Montevideo, Uruguay

Hola Moises.
You are describing an audio problem and I would think it would be associated with the audio circuit since you are hearing it. I would suspect a bad electrolytic capacitor that would block any such noise from the audio amp and speaker. Now the filter cap could be right next to the audio amp or it could be next to the PLL / microprocessor or both. There are some good pics on the NET and here in the files for your reference where these components are. I would replace any suspect ones since you are going into the radio deeply.
It is a simple chassis to work with as it is an easy to disassemble. I will try to find out more and see if I can help out. Also look over the soldering as there might be a bad joint, some electrolytics do not solder well as there may be a leftover flux or simply a cold solder joint, the flow of hot solder does not fuse well if the joint does not heat up to the right temperature. Because the pins of the electrolytic have such a large "sink" for the heat to flow into, these pins are the cold side.

Moises, did you check if the noise is heard also if you tap the audio
from the line out plug? This can indicate if the problem is in the audio
amp section or before.

2433. DE1103 jog dial, then S-meter dies... and then both fixed

Yahoo group: de1103
Date: 2010-01-31 05:50:43 UTC
From: Jason
Topic: 2433 Message: 2433

Hi all,
Please forgive the cross-posting (if you happen to monitor different groups like I do).

Like many others, my jog dial operation became erratic, so I opened up the DE1103 and squirted a bit of electronic quality contact cleaner into the jog dial mechanism, and noticed the jog dial wires at the plastic header plug end looked a bit less than ideal, so I carefully pulled the header pins out, reterminated the wires and reinserted them, as well as strengthened the arrangement with a bit of heatshrink over the wires.

After reassemby of the radio, I noticed the DE1103 signal meter no longer worked. The DE1103 was still as sensitive as ever, and would scan and stop on signals as normal, and the battery meter function still worked fine.

The problem turned out to be the flat ribbon cable that joins the two circuit boards together. I'd used a pair of very fine needle nose pliers to insert the ribbon cable into its plug on the CPU circuit board, and in doing so had pinched/bent one conductor close to the 'free' end of that cable. Straightening out the ribbon cable and carefully reinserting it with my fingers only solved the problem.

If you've an unexplained S meter failure on your 1103, after recently tinkering with its insides, take a look at the very delicate ribbon cable and see if its pinched or bent or has a bit of contaminant on the contacts at the 'free' end. One other (unlikely) cause of failure further down the track could be the 10uF electrolytic capacitor on pin 7 of the TA2057N IC - if that were to go short circuit, the S-meter function would definitely fail and likely also have an effect on AM/SSB reception too.

Jason !
Nice info and with lots of practicality.
I had been in servicing electronic and telecom boards

i definitely felt that you have explained, would be surely useful for those interested in servicing their sets at home.

2435. Re: BFO question

Yahoo group: de1103
Date: 2010-01-31 12:32:34 UTC
From: Julian Hardstone
Topic: 2425 Message: 2435

The DE1103 does not have a 'BFO' in the tube-era sense, it has a carrier insertion oscillator (CIO)
and a proper balanced mixer (demodulator) for SSB. The CIO level is at a fixed high level, all of
which will minimise distortion

I don't know what sort of distortion you are hearing, but I have made a recording of my new DE1103
as I switch the mode for a strong AM signal and try to zero-beat

http://ukradio.info/temp/DE1103-CIO.mp3
In this clip, I switch to SSB after 5s and back to AM at 23s

Maybe I will do a recording of an SSB signal another time, but I find the SSB performance to be very
good

- Julian

Hi Jason. You were very lucky! Those ribbon cables are delicate, and very hard to re-insert without damaging them. I would recommend not disconnecting them unless you really need to! Then be very carefull with them! I have worked on a couple of Kaito KA1103s and a G5, and though it was a little awkward, I managed without disconnecting the ribbon cable.

2437. Ten meters open!

Yahoo group: de1103
Date: 2010-01-31 23:23:11 UTC
From: kb8dns
Topic: 2437 Message: 2437

The ten meter band was open to day and I made a few contacts with my HAM radio, Uniden HR-2510. After this I tried several of my receivers including the DE1103, Grundig G3 and G5 and the SONY ICF-2010. The telescopic antennas heard nothing and the long wire that I normally use was "muddy" at best. Only the SONY fared well on the 30 foot wire. Hooking up my resonant 10 meter antenna to each of the receivers did wonders and all the radios did quite well.
The Degen and the Grundigs work at their best on lower frequencies but the properly cut antenna will let them work much better. So an antenna cut for the 49 meter band would be 162 feet in length. 1 meter equals 3.3 feet.

81 feet would be a half wave (and the right choice for a ~50 ohm match).

Glad to hear 10 was open... it's a great band.

I do not have any clue as to what the input impedance is for most any receiver.... I would assume it would be around 300 ohms. One would think that a tuner used between the antenna and the radio to match the input but one has to have a good ground to complete the antenna circuit. A cut antenna would be perfect match for the frequency but the farther you tune from the match the less it would work unless harmonics come into play.
Receivers are not that "picky" about the antenna but the G3 did not work well at higher frequencies till I used a proper cut antenna. BTW I was using my 20 year old homebrew three element YAGI with a gamma match. It is tuned for 28.400 but will cover well from 26.8 through 29.5 mHz.

It's always good to hear that any of the upper bands are open but 10 m has been difficult for years now. I rememeber the "good old days" 1980s when everything from 10m to 160m was WIDE open and often very long....It was an exciting time in HAM radio.

2442. Caution about static build-up in this dry season

Yahoo group: de1103
Date: 2010-02-04 23:43:03 UTC
From: kb8dns
Topic: 2442 Message: 2442

In an other group I have been reading and posting about static build-up causing problems with receivers such as memory loss, lock-up and front end damage. I thought it would be proper to relate this info here.
Most of you have experienced getting "zapped" when you touch a grounded metal object after walking across a carpet. This kind of action can be bad on your radio and not only from walking on carpet but dryness of the home or radio room. Especially in Winter this problem happens as cold air reduces the humidity and heating drys it out even more. Hot air furnaces can really build up static with the moving air stream. Clothing is another place where this can happen and most any material can become static prone.
To prevent this use a properly grounded station for your radio, avoid using your radio in carpeted rooms, bedding can build up a charge and plastic soles on your shoes can make an electron charge potential just waiting to be grounded. Other ways are to use anti-static spray, wash you cloths and bedding with a fabric softener, use a humidifier or boil water and enjoy a cup of English tea as you listen to the BBC! The water released to the air will help reduce the potential. make sure the cloths dryer is grounded and let your dried clothes rest a bit before you use them.

Hello:

Sorry for my English...

I have my Kaito KA 1103 since two weeks ago.

This is a great receptor but i don't know some data, like antenna impedance.

Anybody knows this value?

Thanks, from Argentina!

Hi Federico - No need to apologise for the English - your English is 10,000 times better than my (non-existant) Spanish! While it is assumed that any good sythesised receiver is a nominal 50 ohms input impedance, most of the manufacturers are (perhaps wisely) not prepared to quote a value! Because of the coupling arrangements, the input impedance can vary widely with change in frequency. If I must give limits, anywhere between 5 and 1,000 ohms! This is why a good, universal antenna tuner can help it doesn't have to handle power, just a wide impedance range. There is one other way an antenna tuner, or better still, a tuned pre-amplifier, can help - most synthesised receivers nowadays (unless one spends over $1,000) do not have the front end tuned. Yes - they may be sensitive, and use very low-noise semicondustors up front, but putting a sharply-tuning device in front can still perform miracles if done the right way!

In general the Antenna impedance of the Receiver is 75 ohms,
while the inverted L antenna (long wire) is said too be 4500 ohms approximately
Perhaps one can think for a matching transformer using a bal-un core , winding 9 turns
towards antenna and 3 turns towards Rx

Hi folks - Having checked the literature and found nothing, I checked the circuit and found:-
1. Using the antenna input socket - J1 - which only works from 100KHz to 30MHz - the signal first goes to a low-pass filter (L109,C135,L110,C132) - typically at 30MHz, then to B1 - which I suspect is a balun, to the gates of 2 FET's (Q6,Q7) which are a balanced mixer. The impedance at this point should be several thousand ohms, but maybe B1 steps up the signal, which would reduce the impedance somewhat.
2. When the attenuator is switched in, an attenuator consisting of R105 (330 ohms) and R106 (68 ohms) is inserted immediately after J1 - this would give an input impedance of 400 odd ohms.
Having analysed this, I stand corrected - for anything below 30MHz, the input impedance should be of the order of 10K (attenuator off) and 400 ohms (attenuator working).
Bob.

Hi Guys. The antenna input impedance is not listed for the KA-1103. However in my G5 manual it states that the external antenna input is designed to work with an antenna fed with 50-75 ohm coax. Since the E5/G5 radios use the same receiver board, thats it.

That said, impedance matching for receivers is not nearly as important as for transmitters. The best way to find what works for you is to just try things.

Hi Tao Qu and Martin,

This is useful information. I knew there was something posted about this earlier but the Yahoo search function does not retrieve posts after March 19, 2009. I have the original model de1103 (purchased on July 2004) and in terms of constant use and entertainment it is the best purchase I have ever made. I recently put up a 75 ft magnet wire (stealth) outdoor antenna but when it was plugged into the antenna jack, the voices in ssb mode were distorted. Wrapping it around the whip antenna solved that problem and, although the background noise was very high, what I could receive was a huge improvement to the 30 ft (indoor) wire that came with the radio. Unfortunately I am about 3 miles away from a 4 tower antenna array of a major AM station which appears to show up all over the place. I solved that problem by attaching the antenna to a 300-75 ohm (twin lead to 1/8 mono-plug) TV balun that came with a portable television. The background noise also diminished considerably without much loss of the desired signal.

Martin - I made the Coleman clothes-line antenna, but I have not had the opportunity to put it to use yet. The ease of assembly makes buying a reel antenna financially irresponsible.

Tao Qu - Are you now retired or will you be selling radios and parts for the de1103 again?

Topic: 2443 Message: 2454

Here is my 2 cents worth.....

The input impedance is dependent upon the front end design and requirement of the FET amps. If the antenna circuit does not match then the FET (front end) will overload or be mismatched to when it cannot "hear". A tuning preamp can help level this out, even a simple homebrew tuning capacitor will help. As far as the quantitative value in OHMs or MHOs is irrelevant as this figure belongs in the design studio.
In a real world the proper antenna match is what you can hear the best with and the radio's signal meter goes up. In SSB there may be no signal but you can still hear them better with a properly tuned antenna. A random antenna will work well at various frequencies, I have good luck wit 30 feet of copper wire, longer or shorter makes the radio "hear" less. I would presume a multiple of 30 feet would do as well.
A band pass filter can help if there is overloading from nearby stations and this is dependent on the selectivity of the radio in use. Amateur radios for HF have these bandpass filters built in but they are selective of the nine amateur bands and the receive goes down a tad when tuned out of the HAM bands. These filters are not included with most SW receivers.
Best way to optimize your station receive is to use a pre-tuner and orient the antenna to lower the noise floor. A home brew tuner is fun to build and makes a neat station accessory. DSP is nice but the few I have tried leaves digital "artifacts" in the headphones.
I guess when it all comes down to the nitty gritty, a good antenna is the key and matching it is better.

2455. Distortion

Yahoo group: de1103
Date: 2010-02-14 14:07:28 UTC
From: john
Topic: 2443 Message: 2455

An earlier poster noted distortion when in SSB using an external antenna. This is not a function of the antenna impedance, but is in fact fundamental overload due to the increased signal strength from the larger antennas.

This happens in all radios. In earlier days, an RF gain control was provided for just this purpose and in early communication receivers, the best way to receive undistorted CW and SSB signals was to turn the audio gain full up, and use the RF gain to control volume . This also had the effect of eliminating the distortion due to overload of the front end, and worked quite well.

The 1103 has no RF gain, and depends on AGC (Automatic Gain Control) to reduce the sensitivity when needed due to the presence of strong signals. This it does quite well on the integral whip antenna, but not so well with an external antenna. Someone posted earlier that wrapping insulated wire around the existing whip helped...indeed it will as the coupling is not so efficient as a bare wire and the gain from the larger antenna is reduced.

The 1103 is plenty sensitive and given its AGC action and lack of manual RF gain control, the alternate (Arm-Strong :-)) method of "RF Gain Control" is to limit the signal coming in the antenna by not connecting a huge wire to it. There's probably a sweet spot beyond which adding length begins to overload the front end of the receiver. This will depend on the frequency , the time of day, etc.

The 1103 is a fine $70 receiver that can fit in one's pocket , and it has some fundamental limitations that one has to live with.

John

Hi Martin and all,

For the DE1103, there are some design changes on the external antenna input socket in history.
On the 1st version, the external antenna input support for FM, SW and FM, and without the pre-amp, but from the 2nd version, it supports the FM and SW only, and added the pre-AMP, so this is why I mentioned don't suggest the too long wire antenna or high strong signal inputs.

For radios selling...actually the 2009, is unluck for me, the continued health problems caused too much troubles to me and my customers. In this 2010, I will full time focus on radios selling, I am working on this now, if you have any questions or help needed, please feel free to let me know.

The input impedance is dependent upon the front end design and requirement of the FET amps. If the antenna circuit does not match then the FET (front end) will overload or be mismatched to when it cannot "hear". A tuning preamp can help level this out, even a simple homebrew tuning capacitor will help. As far as the quantitative value in OHMs or MHOs is irrelevant as this figure belongs in the design studio.
In a real world the proper antenna match is what you can hear the best with and the radio's signal meter goes up. In SSB there may be no signal but you can still hear them better with a properly tuned antenna. A random antenna will work well at various frequencies, I have good luck wit 30 feet of copper wire, longer or shorter makes the radio "hear" less. I would presume a multiple of 30 feet would do as well.
A band pass filter can help if there is overloading from nearby stations and this is dependent on the selectivity of the radio in use. Amateur radios for HF have these bandpass filters built in but they are selective of the nine amateur bands and the receive goes down a tad when tuned out of the HAM bands. These filters are not included with most SW receivers.
Best way to optimize your station receive is to use a pre-tuner and orient the antenna to lower the noise floor. A home brew tuner is fun to build and makes a neat station accessory. DSP is nice but the few I have tried leaves digital "artifacts" in the headphones.
I guess when it all comes down to the nitty gritty, a good antenna is the key and matching it is better.

ä½ å¥½ Tao Qu!

I too had a bad 2009 and happy that it is over! Not that I need another radio but I would very much like to purchase the new Degen DE1106 as it seems to be a notch up on the G3. I have had my DE1103 only about two months and it's simplicity is it's shining star! Mine was used and it came with a missing "kick stand" and I would like to replace it but I do not know where to purchase one and how in the world do you install it? the battery door is simple but the stand....

è°¢è°¢ä½ for your input to the group! 73 es gud DX! Rod KB8DNS

Hi Tao Qu - Can you help me with some information please? In other posts you have mentioned a "version 2" - with a L/W-B/C-S/W RF Amplifier. When I last looked, the only schematics in Files in this group relate to the old, original 1103. Have you any later schematics, and after which serial numbers, etc does which apply?
Bob.

OOPS,
There was a additional '0' inadvertently. I meant that the inverted L would have an impedance of 450 ohms. I watch the other replies with enthusiasm and would like to comment later on various opinions.

Hi All - Unfortunately, there are several different variants of DE1103's - some have an RF stage ahead of the mixer - others don't. Some have the FM antenna going to the external antenna socket which disconnects the telescopic rod when a plug is inserted. Some only have S/W going to the external antenna socket, and not B/C and L/W.
The circuit which appears in FILES in this GROUP seems to be an early one, with no RF Amp, FM not going to the external antenna, and L/W, M/W and S/W all going to the external antenna socket. I've asked Tao Qu of tchina (Apologies if I've got the name wrong!) if he could clarify and provide up-to-date schematics, and any indication of which serial number meeans which model (variant), but he seems to have gone silent on the subject!
Bob.

From: krysatec
Topic: 2443 Message: 2467

Hi all,

I have DE1103 A015058 and i can use antenna input for SW and also for FM band.

I can use also the same antenna input for band 0-100kHz, LW and MW band, but here you must use only tuning by "knob", NO direct setting!

If you use "software modification from Russia" for receiving lower than 100kHz, your feritte antenna is OFF! NOW you can tune by knob in band 0kHz...LW...to end of MW band and you can use ONLY external antenna via antenna input now!

Antenna input is Hi-Z input! You can use "longwire" without "unun" 9:1, but here is not problem if you use also "coax cable" from active preselector etc.

One idea: if you use tunable feritte antenna with short wires to input, you can connect it direct to input: no other you need!
You can use tunable external feritte antenna to receiving lower than 100kHz! (For instance 77,5kHz time station in Europe)

Sorry, I hope that you understan me, i speak english a little!

Best regards, Jara "Rat", Czechia, EU

Hi "Rat",

First of all I agree your opinion about the impedance of DE1103 which is around 300 ohm. By the way I use your preselector which is absolutely great with the DE1103. I buid it around 2005.

Now for those who want listen LW & MW without the ferrite rod and listen under 100Khz, here is the method to apply to store:

DE-1103 : Tuning from 000 to 099 kHz

STORING 000 kHz IN MEMORY "99":

1. retract fully the antenna
2. switch DX/LO to "LO" [aka attenuator on]

Note: step #1 and #2 reduce stopping during scanning

3. turn on the radio
4. enter: 21951 [BAND+]

Note: the display shows no square around any meter band

5. press and hold [BAND-] until downward scanning begins
6. wait for the display to read lower than 100 kHz

Note: this scan process will take about 14.5 minutes

7. press [Band+] to stop while tuned between 0 and 99 kHz

Note: if you go past simply press and hold [Band+]

8. turn the tuning dial until 000 kHz is displayed
9. enter: "99" STORE STORE

Note: now memory 99 has 000 kHz for future access

10. remember to switch DX/LO back to "DX"

FUTURE USAGE

1. enter: "99" [M/F] then press [M/F] again
2. turn the tuning dial upward from 000 kHz

OTHER USAGES

Storing other values into memory while in this mode allows
continuous scanning up or down from those values as well.
==========

The above procedure switches the antenna from the internal ferrite to the telescopic rod or external ant jack, for *all* frequencies including 0 - 1710kHz

73's QRO, Best of all and good DX

From: bobyorston
Topic: 2469 Message: 2469

Hi Folks - I picked up a DE 31 for just about the right price. I would have kicked myself if I'd paid $30, as it used to be, but I guess its previous owner has effectively "traded it in" on a DE 31 MS!
Has anyone got a circuit or a detailed manual?
I remember somebody commenting that he'd opened the control box up, and there was an IF transformer - presumably in the output circuit.
I can elaborate on that slightly -
The "amplifier" consists of one varicap in parallel with the loop, then one FET.
The "control box" consists of the 2 AAA cells, a power switch, a RFC and output coupling capacitor. Everything else in the "control box" is involved in steering the varicap - 2 transitors feed the "IFT" oscillator/step-up coil - half-wave rectified and filtered, gives +13.2V to the pot - moving arm goes to the varicap, giving +0.4V (4MHz) to +13.2V (22MHz) to reverse-bias the varicap.
The cable between the "control box" and the "amplifier" is:-
Outer = earth.
Next = varicap control voltage (+0.4V to +13.2V).
Centre (tip) = DC supply to/output from the "amplifier".
While I haven't met a DE 31 MS, I suppose there is a switch on the "amplifier" to connect a higher capacitance varicap across the original one.
Any comments - actual circuits - manual - anything?
Bob.

2470. DE1103 External Antenna Impedance

Yahoo group: de1103

From: Tao Qu
Topic: 2443 Message: 2470

Hi All,

Per talking with the designer just now, here is the answer about the impedance of the external antenna input on the DE1103 radio, FYI.

a. the 1st version DE1103 radio has the external antenna input support for MW band and SW band, there was no RF signal pre-amp for external antenna input.
b. from the 2nd version, the external antenna input is for SW band and FM band only, and has the RF signal pre-amp added.
c. from the 2nd version, the external antenna input impedance is around 1K Ohm, it is the high impedance design (sorry for my incorrect input of 50 Ohm in before).

Hi Tao Qu - Thanks a lot for the information! I have three DE 1103's - one from you, the others second-hand - one as low as $15. With all of them, putting a dummy plug in the antenna socket kills FM, so by your definition, they are all MkII. Naturally, when one engages the <100KHz mode, the antenna socket works on B/C and L/W.
If the information is available, could you please help with schematics for MkII, as there is only a MkI on file, and, for those who cannot diagnose MkI vs MkII, are you able to say "below serial number ..... is MkI"?
Regards,
Bob.

2475. Where is the Serial Number?

Yahoo group: de1103
Date: 2010-02-19 22:43:25 UTC
From: brunomarado
Topic: 2443 Message: 2475

Hello,
I bought a DE1103 last January, and I'm impressed with it!
Unfortunatly I looked everywhere and I can't find a serial number, just a stick inside the batt compartement with the writting "12/2009" that I believe should be the manufacture date. Where is the Serial number on your radio?
By the way, does anyone have an idea about how many DE1103/KA1103/T&K have been produced up to today?

Regarding the Ext. ant. impedance, I use a DEGEN DE31MS active antenna with both my Eton E1 (50 Ohm input) and my DE1103, and I don't see any difference on their behavior. Both perform well with the DE31MS. What does this means regarding the DE1103 ext. ant. impedance?

Best regards,
Bruno
Portugal

Hi - The sticker inside the battery box normally has the serial number on it - I think it's normally a letter followed by 7 numbers.
Bob.

Subject: [de1103] Where is the Serial Number?

Hello,
I bought a DE1103 last January, and I'm impressed with it!
Unfortunatly I looked everywhere and I can't find a serial number, just a stick inside the batt compartement with the writting "12/2009" that I believe should be the manufacture date. Where is the Serial number on your radio?
By the way, does anyone have an idea about how many DE1103/KA1103/ T&K have been produced up to today?

Regarding the Ext. ant. impedance, I use a DEGEN DE31MS active antenna with both my Eton E1 (50 Ohm input) and my DE1103, and I don't see any difference on their behavior. Both perform well with the DE31MS. What does this means regarding the DE1103 ext. ant. impedance?

Best regards,
Bruno
Portugal

Hi Peter,

Yes, that is the answer I got from the designer. For the schematics, sorry I don't have the new in hand also, but I checked the one in the group file section, seems it is same as the one in my hand in currently.

Regards,
- Tao Qu

Subject: [de1103] Re: DE1103 External Antenna Impedance

Hi Tao Qu,

Many thanks for getting back to us with an authoritative answer !
So the final verdict from the designer of the DE1103 is that the external antenna input impedance is:

"around 1KOhm"

Tao Qu, as per Bob's suggestion, if there are any schematics more recent than the ones available in the files section and you have access to them, would you be able to upload them ?

regards
Peter

Hi Bob,

From 003 to now, there are some different versions on the DE1103 radio, the latest # in currently is Rev IV and running on this version for long time already, so I think the units in your hand should be the latest Rev IV version.

For the "dummy plug" you mentioned, I am not clearly understand about it, but you can return it back to me for repair. -:)

Hi All,

I uploaded the schematics I have to group already, but I didn't find any difference with the others.

a. when the external antenna plugged, the telescopic antenna is disabled.
b. Q1 is for the SW signal RF amp (both for telescopic antenna and external antenna).
c. Q14 is for the LW and MW signal RF amp (ferrite rod only).
d. IC1 is for the FM signal RF amp and some other functions.

Subject: Re: [de1103] Re: Antenna impedance

Hi All - Unfortunately, there are several different variants of DE1103's - some have an RF stage ahead of the mixer - others don't. Some have the FM antenna going to the external antenna socket which disconnects the telescopic rod when a plug is inserted. Some only have S/W going to the external antenna socket, and not B/C and L/W.
The circuit which appears in FILES in this GROUP seems to be an early one, with no RF Amp, FM not going to the external antenna, and L/W, M/W and S/W all going to the external antenna socket. I've asked Tao Qu of tchina (Apologies if I've got the name wrong!) if he could clarify and provide up-to-date schematics, and any indication of which serial number meeans which model (variant), but he seems to have gone silent on the subject!
Bob.

From my tests results that the input is not active in the LF band - my receiver reacts to signals fed to the antenna socket only if tuned above 500 kHz. Can anyone confirm that the 1103 antenna input works as low as 100kHz?

Thanks!

Hi Tao Qu - By "dummy plug" I meant a 3.5mm stereo plug - with nothing connected to it - inserting that into the antenna input socket will "kill" FM - as it disconnects the telescopic antenna in later sets, not in earlier ones. Incidentally, I have a MkII - no protective diodes - now added, which had several dry joints around the 1st mixer. Also a MkIV - fine. Also a MkIIIV - this can't be Roman Numbers, because such a number wouldn't exist - dry joint in S/W pre-amp.
Regards,
Bob.

2482. VOL problem

Yahoo group: de1103
Date: 2010-02-22 12:20:31 UTC
From: hermolaus
Topic: 2482 Message: 2482

Hello everyone!

I'm Hermolaus (that's my internet ID) and I come from Poland, Europe.

I'm a Degen DE1103 user since last year. I bought it from a friend.

My DE1103 used to work like that:
On the main area of LCD it used to display frequency in big digits.
In the right upper corner (there is a place for smaller digits) there was nothing displayed.

When I wanted to change volume, I used to press "VOL" button, and DE1103 used to display two smaller digits in the upper right section of the LCD and the blinking "VOL" indicator. The digits were for volume value. After 2-3 second both digits and "VOL" indicator used to disappear.

DE1103 used to display in the same place memory cell number while using memory. And then, after leaving it, the digits and "MEM" indicator also used to disappear.

That was the the way my DE1103 used to work till last weekend.
On Saturday I was listening to the radio and my alkaline batteries were going weaker and weaker. After a while the radio displayed the blinking indicator for exhausted batteries. Nevertheless I decided to run on them till the very end. To monitor their currency I pushed the "VOL" button. Than on that moment a strange thing happened. The LCD showed the battery sign and the bars on the upper left side of the LCD, and - as usually - the "VOL" indicator and two-digit volume value on the upper right side of the LCD. Then, after 2-3 seconds, the battery sign and bars disappeared, but the "VOL" sign and the two digits on the upper right side remained. The only difference was that the "VOL" indicator stopped to blink.

I tried to reset the radio using the "RESET" button, but it didn't help at all. I changed the exhausted batteries I was using to the new ones, and it didn't change anything. I also removed all the batteries from my DE1103 for a day long to reset it, but it also didn't help.

The result is that as soon as I turn on my Degen it shows the frequency on the main part of LCD, and it displays the "VOL" indicator and two-digit value value on the upper right corner of LCD continuously. The volume remains to be displayed all over the time.
When I now push the "VOL" button the "VOL" indicator simply starts to blink for 2-3 seconds, and then it remains displayed continuously (instead of disappearing).

My questions are:
1) Did something similar ever happen to anyone of you?
2) What is the way to solve the problem?
3) Is there any way to reset DE1103 and the whole memory? Pushing the RESET button didn't help, and actually didn't reset the whole radio, since it still has the same frequencies in the memory section.

TIA!

Hermolaus
from Poland

Hi

What you have described is normal operation, if you want to have the memory displayed (or volume level) all you need to do is to press the M/F button on the top left hand front corner, this will toggle between the two.

Paul

From: Marco Pozzobon
Topic: 2485 Message: 2485

Hi to everyone,
I own a Degen 1103 from
some
years. I did the modify to reach freqs above 100 khz some days
from its
arrival, and no hardware/electronic modify was made inside. So,
my Degen
worked properly for a long time...
After a period of
inactivity of some
months, I've turned on it once more to hear SW , but, I don't
know why,
now it's impossibile to tune
any signal
all over SW or MW frequencies! :-(
I've tried to
reset, open
and close the radio to check if anything is disconnected or
damaged
(even if I powered it always with accumulators). Nothing helped to make it tune again
stations in SW or MW. Only in FM it works perfect.
Until the
day it
stop working, I used a simply random wire and Degen Loop antenna as additional hardwares.
It was always poered with accu (and these were always charged with their own charger). I
know that software mod to receive under 100 khz esclude the internal ferrite antenna, but
connecting any type of external antenna (loop, wire) changes this situation!
Please help!
Thanx in
advance!
Marco

Marco,
one possibility is that the front-end transistor (FET) has blown due to static high voltage. That is a classical problem of this receiver, although the latest versions seem to have a protection circuit for the FET. The obvious cure would be to replace the FET.

The DE1103 is also known as an idiosincratic radio as to its software and problems may arise when the batteries are left to discharge to very low voltages, causing the microprocessor to operate in mysterious ways. I have heard that when this condition occurs it is very hard to get out of it, usually just resetting the unit won't work and it is often necessary to take the batteries out and leave the radio unoperative for a long time before attempting a general reset.

Hope this will help

Thanx Moises!

Your help is very appreciated!
Hoping all electronic components are sill in good condition, I'm trying the first solution: removing accumulators and leaving the radio unoperative. This is the 2nd time I'm doing this operation: batteries had to be charged, so I left unoperative the radio for 6-7 hours (I use only batteries or accu)... but when I turned it on again, nothing changed!

A guy suggested me this test to check if local oscillator works properly:
- Tune 10Mhz (the oscillator generates a signal at 55.845 or 65.845 Mhz.)
- Use a scanner (or better a frequencymeter) to check signals on these freqs.
I did this test with a scanner: level meter notes a signal at 65.845 Mhz.... It seems that oscillator works properly...

If front-end transistor (FET) is the problem, have you an idea where to find a replacement and relative documentation?

Thanx again,

Marco.

Sorry for so many questions, but I just think I got a bad unit. I hear a ton of static in the unit and it barely picks up any SW even at night.
This is not my first radio,my other radios did pick up signals.
My adapter says 200 ma and 5v, all of the radios on EBAY says it has a 8V 300 volt.
My radio works better on batteries. Maybe I also have a bad adapter too. Gosh maybe I have been scammed?

Hi Phyllis - A normal adaptor for a DE1103 should give at least 6V. The total currnet drain of the radio should be 100mA, and the chrging current for the batteries should be another 100mA, so 200mA in toyal should be fine. One other thing, it is better to use a normal old-fashioned (un-regulated) plug-pack - not a modern, compact, switch-mode plug-pack, as the interference caused by the latter is positively unreal! It would be cheaper to buy a suitable one locally than to get one from China.
In regard to poor short-wave performance, is the switch on the top left-hand side (ATTENUATOR) in the correct position?
\Bob.

I had a similar problem with the adapter.

In my case, the input voltage was 110 V when in Argentina the electric
line is 220 V. I could use a 220V/110 V transformer but, this isn't
very "portable".

And so, I used an "old" 12 V adapter, I opened the plastic box and I
could solder a voltage regulator LM 7808.

This work fine for me.

Bye!

Yes, the dx switch is on. The sounds are muffled.
I made sure the SSB switch was not on. The shortwave comes in better when I run the unit on batteries. When I connect it to the SOny adaptor is when a lot of noise really comes in.
What kind of adapter should I get?

Thanks
Phyllis

Hi All - Tao Qui shouild know, as he sells and (I think) services them, but -
1. Some manuals say 8V, 300mA in specifications.
2. Other manuals say 6V, 300mA in specifications.
3. If the circuit is to be believed, there is only D11 (a power diode) and Q26 (an S8050 transistor - presumably pulled into saturation by R803 (2.2K ohms)) in series with the batteries when an AC Adaptor is plugged in.
4. There are 3 DE1103's here - all of them have come with 6V, 300mA supplies - 2 of them unregulated, 1 being a more compact (dreaded) switch-mode one! Mind you, unlike all the other accessories, none of these supplies have Degen anywhere on them.
5. As this could be a way of charging the cells faster, later on today, I'll check the charging current when using a regulated power supply to generate between 6 and 8V.
Bob.

I was able to fix my Degen with the same problem. That was the fet I used. Of course you should purchase a few for the future.It's not that
hard if you have some soldering experience. You need a fine point low wattage soldering iron, magnifier, de-soldering braid, fine gauge solder and some way to ground yourself when handling the fet. A quick way is to wrap a few turns of wire around your wrist and ground that to a water pipe or other known ground. Use the pictures in the files, they helped me. Use the iron very briefly with the de-soldering braid, you might need a toothpick to pop the old fet off the board.Center the new fet on the pads carefully and use that toothpick to hold the fet steady while you just tack one tab with the iron. If you are confident all is aligned then tack the other tabs down, but this time with a little solder. Wait between applications of heat and finish off with some solder on the first tab. Mine worked after this. Good luck. Jerry --- In de1103@yahoogroups.com, "Nelson B" <greenbrier614@...>

I was able to fix my Degen with the same problem. That was the fet I used. Of course you should purchase a few for the future.It's not that
hard if you have some soldering experience. You need a fine point low wattage soldering iron, magnifier, de-soldering braid, fine gauge solder and some way to ground yourself when handling the fet. A quick way is to wrap a few turns of wire around your wrist and ground that to a water pipe or other known ground. Use the pictures in the files, they helped me. Use the iron very briefly with the de-soldering braid, you might need a toothpick to pop the old fet off the board.Center the new fet on the pads carefully and use that toothpick to hold the fet steady while you just tack one tab with the iron. If you are confident all is aligned then tack the other tabs down, but this time with a little solder. Wait between applications of heat and finish off with some solder on the first tab. Mine worked after this. Good luck. Jerry --- In de1103@yahoogroups.com, "Nelson B" <greenbrier614@...>

From: Tao Qu
Topic: 2497 Message: 2506

Hi Bob and all,

The original correct unit should be +8V / 300mA supply with plug of center positive. But for 220V/AC input units, it has the label printed is +6V, in fact if you do the test, then you will find it still is +8V output.

Regards,
- Tao Qu

Subject: Re: [de1103] Adapter

Hi All - Tao Qui shouild know, as he sells and (I think) services them, but -
1. Some manuals say 8V, 300mA in specifications.
2. Other manuals say 6V, 300mA in specifications.
3. If the circuit is to be believed, there is only D11 (a power diode) and Q26 (an S8050 transistor - presumably pulled into saturation by R803 (2.2K ohms)) in series with the batteries when an AC Adaptor is plugged in.
4. There are 3 DE1103's here - all of them have come with 6V, 300mA supplies - 2 of them unregulated, 1 being a more compact (dreaded) switch-mode one! Mind you, unlike all the other accessories, none of these supplies have Degen anywhere on them.
5. As this could be a way of charging the cells faster, later on today, I'll check the charging current when using a regulated power supply to generate between 6 and 8V.
Bob.

Hi Phyllis - You are after any unregulated (not switch-mode) plug-pack which can give 8 volts at 300mA.. A lot of them come with adjustable voltages and interchangeable plugs. Get the expert in the shop to set it for about 8 volts unloaded, which should drop to about 6 volts with a load on it, with the centre pin +. Of course, you've got to find one which has a suitable range of plugs to include the correct size. If the worst comes to the worst, get someone to cut the lead off the Sony adaptor, as it obviously fits, and solder it to your new supply. If you have access to a multimeter and soldering iron, you can do this yourself!
Bob.

Subject: [de1103] Re: Adapter

Yes, the dx switch is on. The sounds are muffled.
I made sure the SSB switch was not on. The shortwave comes in better when I run the unit on batteries. When I connect it to the SOny adaptor is when a lot of noise really comes in.
What kind of adapter should I get?

Thanks
Phyllis
--- In de1103@yahoogroups. com, Bob Yorston <bobyorston@ ...> wrote:
>
> Hi Phyllis - A normal adaptor for a DE1103 should give at least 6V. The total currnet drain of the radio should be 100mA, and the chrging current for the batteries should be another 100mA, so 200mA in toyal should be fine. One other thing, it is better to use a normal old-fashioned (un-regulated) plug-pack - not a modern, compact, switch-mode plug-pack, as the interference caused by the latter is positively unreal! It would be cheaper to buy a suitable one locally than to get one from China.

Hi Phyllis

As an alternative, you could abandon using the plug-pack and charge the batteries using an external battery charger and if need be, running the radio on standard batteries while the main battery set is charging.

I live in an area where my mains voltage is 220 volts and the power pack which came with my radio was 110 volts so I had no alternative but to use an external charger.

Paul

Base on my selling history:

#1. for 220V input unit, it has the label printed is 6V/300mA output.
#2. for 110V input unit, it has the label printed is 8V/300mA output.

#3. in fact, for both #1 and #2, all has the real output is 8V/300mA, the #1 is the label print problem only.

2517. YJ-7 FET for DE1103

Yahoo group: de1103
Date: 2010-03-15 21:43:35 UTC
From: Tao Qu
Topic: 2485 Message: 2517

Hi Marco,
It is free, so please send your address to me directly is ok.

Hi All,
If anyone need this YJ-7 FET, please let me know also, so I can arrange the shipment together, it is about 30 miles driving for me to go to my shipment agent, so I would like to arrange the shipment at same time.

My contact window is tquchina@....

Regards,
- Tao Qu

Since 9v supplies are easy to come by (even though these things are unregulated and vary all over the map) one could just use a 9v unit with a series diode to drop the V to the more unusual 8V rating. Unloaded it's probably in the 12-14 v range.

Topic: 2497 Message: 2519

Good suggestion!

Adding a series diode will drop about 0.7V and the left is ok for DE1103 use. The simple example diode is 1N4001, it is cheap and easy to find.

From: Bob Yorston
Topic: 2497 Message: 2520

Hi Tao Qu - Now for something entirely different - with the DE31 and DE31MS - there seem to be complaints from some users in regard to the DC/DC Convertor used to step the 3V up to 13V. As it oscillates anywhere from 2.5 to 3MHz, and as that oscillation is readily "picked up" by the cabling, it is a source of annoyance to some users. Could you put to Degen the idea of using a higher value potentiometer, and a FET to switch on/off a tiny 12V battery (such as is used in alarm remote controls) which could be put in series with the 3V - giving a total of 15V - instead of the DC/DC Convertor?
Bob.

□
Base on my selling history:

#1. for 220V input unit, it has the label printed is 6V/300mA output.
#2. for 110V input unit, it has the label printed is 8V/300mA output.

#3. in fact, for both #1 and #2, all has the real output is 8V/300mA, the #1 is the label print problem only.

I live in Portugal and when I bought my DE1103 I clearly requested an European 220V plug AC adapter (to avoid mistakes).
It came with and adapter that works fine and that has written the following:
GPE AC-DC ADAPTER
MODEL: SY-08020-GSA
INPUT: 230V~50Hz
OUTPUT: 8V/200mA 1.6VA

Best regards
Bruno
Portugal

From: bobyorston
Topic: 2497 Message: 2521

Hi Tao Qu - Tou are correct in regard to AC Adaptors, of course. All of mine are labelled 220V to 6V, 300mA, but give 8V at 300mA. Inside 2 of them is a transformer, 4 diodes making a bridge rectifier, with the 4 0.01uF disc ceramic C's across them to keep the noise down, and a 7808 regulator, with 1000uF before it, 220uF after. The 3rd one, unfortunately, has got a switch-mode supply, which fits in the box perfectly, but also radiates interference very well!
However - going by the circuit of the DE1103, I can't recommend using a 9V plug-pack, even with a 1N4001 in series, because the unloaded voltage of such a supply can be 13V. Sure - there are voltage regulators feeding the logic, but the transistor regulators feeding the RF/IF/AF seem to be hard on/hard off. Even connecting a well- regulated, current-limited and metered supply onto a DE1103 I observed a sudden current increase at 8.9V, so I didn't go any further to "see where the smoke came out!"
As a result, do you think you could supply the original regulated (preferably not switch-mode)supply to anyone who needs one, at a reasonable price?
The alternative would be for them to take a 12VDC supply, and either a 7808 and 220uF filter C after it, or a 7805, 100 ohms from output to common, 68 ohms from common to negative,followed by the 220uF. This alternative is easy for anyone "in the know", but not so easy for a non-electronic person - probably your usual user!
Regards,
Bob.

That's disappointing Marco, since they are the only electronics supplier I was able to find in a Google search that didn't sell them in bulk. Hopefully our friend TQ will come through, but if not maybe someone who purchased enough spares could pass them along to you.

Yes, for sure!. But first, let's start getting raw material! :-)
I've just found a e-shop here in Italy:

http://it.farnell.com/nxp/bf861b-215/jfet-n-chan-25v-sot-23/dp/1758057

Is this the correct FET replacement?

So is there demand for this? I can order for you, but it's going to be a bit spendy (while only ten cents, there's $4 to get it to me, plus international post to you).

I'm happy to do that if you cant find another source

Marco - Before you start pulling out SMT devices, this needs more diagnostic work, maybe including
voltage measurements

What 'front end transistor' do you want to replace? Q1 is used for the SW whip antenna and could
indeed be damaged by static, which would reduce the sensitivity so you could only hear very strong
SW signals, but the internal ferrite rod antenna would still operate on MW - can you confirm that
you cannot even hear strong local signals on MW?

The Local Oscillator test is very useful, and seems to show that the PLL and the microcontroller are
working correctly. If there is no sign of signals, I think you should be looking further to the
'rear end' - starting with the 2nd conversion oscillator, which seems to give problems on many of
these radios. Again, use the scanner to see if you can find a signal from the 1103 at 55.395MHz
(?1kHz). If the oscillator is not working, very slight adjustment of the ceramic core in the
transformer next to the little spring may cure the problem
http://ukradio.info/Degen/TC3.JPG
BTW, this is the core to adjust if your 1103 only receives on alternate frequencies on AM, like
10001, 10003, 10005 etc

Anyway, why would you prefer to use a BF861B to the original YJ-7 device, which Tao Qu has so
generously offered?

HTH - Julian

If the 1104 does what you need it to do, you may want to Check out the Tecsun PL310 or PL380. They are the current darlings of the Ultralight DX crowd. Both have multiple bandwidths (5 I think). They are ture AM MW and FM dx machines in a small package. Pretty darn good on SW as well. You do give up coverage of SW above about 22 Mhz, and no SSB. The things that the Radios do though, they do very well.

What kind of MW antenna do you think that yu want? There are lots of passive loops out there (Select-A-Tenna, Terk, etc.), or you can build your own for not very much money. There is the CCrene twin coil, and Quantum antennas too for a bit more money. Jay Allen, the person that did the 1104 revies, has reviewed several loops on Eham. Do a search.

It is hard to give an answer on antennas unless we know what exaclty you want to do with it and how much time or money you want to spend on getting an antenna.

I fogot to mention the PK loops series of antennas. This guy is in Australia and makes a whole line of loop antennas, both passive and active for different bands. He will even build to order for your spsecific needs. I use hie amplified AM loop and I really like it. Do a search on PK Loops for reviews or visit here:
http://www.amradioantennas.com/am_antennas.htm

I have no connection with these guys other than being a satisfied user of their products!

http://radiointel.net/radio-receiver-reviews-info/degen-de1104/

I compared them in detail in this review. Remember..there is no BEST radio...each a\has strengths and weaknesses and which best suits you si often a matter of what you value most in a radio.

Any of the small passive loops will do wonders with either radio... Selec-A-tenna, Terk AM Advantage, Tecsun S200 etc...all similar in perfomrance. Iv'e wirtten comparison reviews of those on the site as well.

The Akai APW20 is the same radio as the AnJan DTS-09, it does have a lot of neat features, but according to the two reviews that I found, the radio is not great performance-wise:

http://www.eham.net/reviews/detail/8064

http://herculodge.typepad.com/herculodge/2009/03/selling-on-ebay-the-anjan-dts09-looks-like-a-degen-.html
(the comments contain the reviews)

2539. Noise in recording stations

Yahoo group: de1103
Date: 2010-03-27 10:18:34 UTC
From: Federico Tomasczik
Topic: 2539 Message: 2539

Hello!:

The noise produced by my computer is low, since I put a filter line into power supply.

Now, I can listen my KA-1103 close to PC with little noise.

It's ok, but...

I can't conect the PC (mic or aux inputs) with my radio (line out) to record some stations because de noise is very strong!

Also, I can listen a local AM station in low bands (75 m - 41 m).

The "best" results I obtuve was with a twisted pair, but also it's impossible record.

Anybody have this problem?

How I can filter it?

Thanks!

Hi Federico - It's been a while! As you've discovered, computers and sensitive radios don't go together.
However, here are some more things you can try -
1. Use a 1:1 microphone transformer, or similar, so there is no actual connection between the computer and the radio.
2. Take any toroid, and put several turns of your wire through it - whether it is shielded cable, or twin-flex, so that there is a fair amount of inductance between the computer and the radio - must be the same inductance on each lead.
3. On the radio side of either the isolating transformer or toroid, put a capacitor between the leads, so that it is a low impedance to RF, but a high impedance to AF - something like 0.001uF to 0.01uF.
4. If all of these ideas fail, it's time to use some other recording device!
Regards,
Bob.

This was the big solution!

I used a audio transformer small (1:1) and the noise was decreased.
Also, the local station has dissapeared!

> 2. Take any toroid, and put several turns of your wire through it - whether it is shielded cable, or twin-flex, so that there is a fair amount of inductance between the computer and the radio - must be the same inductance on each lead.

I used toroid but the noise is the same with or without it. I think it
is small (about 12 mm of diameter and only 6 turns for each wire).

i can't get any other toroid now, but on Monday i will try with this :)

> 3. On the radio side of either the isolating transformer or toroid, put a capacitor between the leads, so that it is a low impedance to RF, but a high impedance to AF - something like 0.001uF to 0.01uF.
> 4. If all of these ideas fail, it's time to use some other recording device!

i can still listen some noises, but in general, the transformer has
improved the signals into PC.

And the twisted pair is better that others cables like coax or
shielded for audio.

Thanks for you ideas!

I stuck mine in an Altoids tin:
http://dwarmstr.blogspot.com/2009/06/audio-isolation-transformer.html

I found the computer was not so much adding noise but providing a connection to a poor RF ground system.

I was just about to write that neither Altoids nor tins have anything to do with isolating grounds of differing potentials until I read that people actually make a point of sticking things into Altoids tins <http://en.wikipedia.org/wiki/Altoids#The_Story_of_Altoids> other than mints !

How would one select the DC resistance of the transformer's primary and secondary coils ? The last link given used 600Ohm 1:1 Modem transformers. What is an optimal resistance ?

2544. looking for a used 1103

Yahoo group: de1103
Date: 2010-04-01 13:50:12 UTC
From: aircheckclover
Topic: 2544 Message: 2544

Hi all;

Does anyone have a used working or semi-broken 1103 they want to part with? I have a project in mind.

Minimally, the FM & speaker must work.
Ideally, the entire radio will work.
Cosmetics not so important but kickstand must be in tact.

We should probably take the buy/sell part of this off-line.
I'll report back to the group when the project is done.

Thanks,
Mark

Johan;

This is a fun project and I want to keep details under wraps until I can take pictures and do a full description.

What I can divulge is the 1103 is the perfect candidate for modification into a super-duper AM/FM/Short Wave/International Broadcast portable radio. It will have no equal, at any price.

I've done a proof-of-concept with my nice shiny 1103 but since the permanent modification will require case disfigurement, I'd rather find a used 1103.

Anyone have a 1103 they can part with?

Mark

I thought this was fairly useful <http://www.tape.com/resource/impedance.html>:

...
A few decades ago in the vacuum tube era, it was important to match the output impedance of the source to the input impedance of the load. Usually the source and load impedances were both 600 ohms. If the source impedance equals the load impedance, this is called "matching" impedances. It results in maximum POWER transfer from the source to the load. In contrast, suppose the source is low Z and the load is high Z. If the load impedance is 10 times or more the source impedance, it is called a "bridging" impedance. Bridging results in maximum VOLTAGE transfer from the source to the load.

Nowadays, nearly all devices are connected bridging -- low-Z out to high-Z in -- because we want the most voltage transferred between components.
...

SHOULD I CONSIDER IMPEDANCE WHEN I CONNECT TWO LINE-LEVEL DEVICES?
This is seldom a problem. In most audio devices, the impedance of the line output is low -- about 100 to 1000 ohms. The impedance of the line input is high -- about 10K to 1 Meg ohms. So every connection is bridging, and you get maximum voltage transfer. Some audio devices, such as passive equalizers, require a terminating resistor at the input or output for best performance.

It is painful to note that the radio is dead.

After all it consists of lots of parts and number of sections. perhaps it could be restored, I fondly hope, unless the controllers have died. Of course it calls for handling skills as most sections are SMDs.
and not impossible.

Most literature is available courtesy of our valued members.

Mvs,
yes I know something could have been done, but it would have required too much time for the value of the radio... and today, more than some years ago, time is gold money for me!

2554. how to use the de31ms - some problems

Yahoo group: de1103
Date: 2010-04-15 17:45:33 UTC
From: bonvino.raffaello
Topic: 2554 Message: 2554

Hi all, this is the first time that I write on this board, so i would ask you how to use de de31ms togethet with the de1103. When I attach the antenna to the receiver trough the 3,5 mm jack I notice an upgrade in the reception in the short waves (tuning the knob on the unit and selecting SW on the antenna), but if I attach the ferrite rod to the antenna and put it on my radio and select MW on the antenna I don't hear any change in the reception in the medium waves (neither in statics). Did anyone experienced the same problem? How to solve it? Thanks in advance.

if the DE31ms is supposed to work for Medium wave, , try making a 6turn wireloop around your radio and connect it to the two leads of the loop to the de31ms wires
as you connect, you would find that it would help improve medium wave by coupling from the 6 turn loop
.

Yes, you have to connect the de31ms to the ferrite rod. Then install the rod on the top of DE1103. Try the best position for the max gain.It's around 5 cm from the left, up to the VOL button. Good luck, good DX.

Yes, with the DE1103 the only way to couple the external antenna on MW is by means of the small ferrite rod provided with the antenna. The external antenna jack does not work on MW.

I have some experience with the TG34, which is basically the same kind of antenna, and I found that the DE1103 has already a good reception on MW, and it won't be enhanced significantly by using the TG34 and its coupling ferrite rod.

With other less sensitive receivers however I found a noticeable enhancement by using the antenna.

Hope this will be useful

Thanks. As a matter of fact I have a very good reception on MW expecially during night time (I can also hear Radio China International on 1458kHz here in Italy with full strenght of signal).So, can I use the radio with the only internal antenna on MW? It's the same thing as using it with the external antenna? Have I to use the magnetic loop only in SW where the

radio is less sensitive or receives a lot of noise without external antennas?

If you want to connect an external antenna to the antenna socket of the DE1103 for MW & LW, you must
use the well-known 'trick'

Select 1711 by direct entry:
[1] [7] [1] [1] [band+/AM]
and scan down: hold [BAND-] for 2 seconds.
As soon as the frequency is below 1710kHz you can stop the scan and
use the rotary control, or you can let the scan continue below 100kHz.
The antenna is now switched for the telescopic or external antenna.
I suggest you tune it down to zero and store this in preset 0, or store
99kHz in preset 99. Also store any frequencies for which you wish to
use the external antenna input. You can store any frequency with the
[SSB] mode 'on' for CW reception.
Once you enter a frequency or change band on the keys, the system will revert to the normal tuning range and with the ferrite rod for MW + LW.

If you are happy with MW reception, you may not need more antenna. If you are unhappy with SW, a loop will help reception - more signals, less noise.

Mark

I thought I would reply to this thread by posting a picture of an old time radio receiving set up from the early 1920s. Especially the loop antenna that appears to be for the MW band. Not sure how selective radio receivers were in those days but most were of the TR type.

Thanks to everyone for your answers. Can you give me another advice please? Can I receive weather fax using my de1103 in the south of Italy? Can you give me some working frequency together with the time schedule and the details about the transmission modes? Thanks

Interesting... but it hasn't SSB mode! I need it!
I read many radio blogs & forums, but rumors and unofficial news about 1108 model don't go beyond 2006... Degen aborted this project?

yes. ooner or later, they have to implement DSP based Radios with chips like Si4735 instead of conventional dual conversion.
otherwise they may face competition. I only wish that DEGEN and Kaito should incoerporate in-built DRM reception, while retaining SSB and CW of course. Let us see

Do you think they stopped 1108 project to wait a DRM license or the diffusion of a similar digital broadcasting standard?

From: gabrielddc
Topic: 2572 Message: 2572

I'm desperate.
I bought a Degen de1103 three days ago, but today he introduced a problem.
I can't hear anything in the frequency with final 1,3,5,7,9 when I'm scanning. Frequencies in the final pair (0,2,4,6,8) is normal.
For example, I can't hear anything in 11.925mhz but I can hear in 11.924mhz or 11.926mhz

See a video of what is occurring:

http://www.youtube.com/watch?v=voQRg3t6_Ow

If someone can help me I thank you very much!

I'm desperate.
I bought a Degen de1103 three days ago, but today he introduced a
problem.
I can't hear anything in the frequency with final 1,3,5,7,9 when I'm
scanning. Frequencies in the final pair (0,2,4,6,8) is normal.
For example, I can't hear anything in 11.925mhz but I can hear in 11.924mhz or 11.926mhz

See a video of what is occurring:

http://www.youtube. com/watch? v=voQRg3t6_ Ow

If someone can help me I thank you very much!

Hi - My first thought is - send it back to the supplier. If that's not possible/practical -
My second thought is - earthing the collectors of Q9 and Q10 (both S9014) will mean that
the AF output chip (CXA1622P) is never muted, so that whatever is going wrong with the
logic can no longer tell the output stage to mute.
Bob, VK2CAN.

Please don't panic. There are other stories like yours in this forum. Please search the messages using appropriate keywords such as "odd" and you will find some messages from people with the same problem. One of them "stefy506" had a happy end as it was discovered that a 10 pF capacitor was missing. May be your receiver has a similar fault that could be repaired

Regards,

Moises

Hello " gabrielddc", no panic!!!!quiet!!!I saw you problem for "step silent"......
please , see articles in these messages = http://groups.yahoo.com/group/de1103/msearch?que
ry=stefy506&submit=Search&charset=ISO-8859-1

I hope you find solution !!!!

"C616 (10 pf)what was not present! he was lacking from the factory!!!"

My problem and is moment = OK!!!!!!

(good reading articles to see if the same problem tks!)

Stefano.

2578. recent SW loggings

Yahoo group: de1103
Date: 2010-05-11 17:55:07 UTC
From: Earl Higgins
Topic: 2578 Message: 2578

LOGGINGS

All made by Earl Higgins, St. Louis, Missouri, USA using a
Degen DE-1103 with built-in whip. All times/dates are GMT.

15540 Radio Nederland 2010-04-13 2203-2227*: Bonaire, Netherlands Antilles
DUT fair, noted man talking shortly after top of hour,
station wasn't there before the hour, language initially
unknown/sounded Germanic, announcement (presumably sign-
off) at 2226, instrumental anthem, carrier cut

11590 Radio Cairo 2010-04-13 2310-2314: Abu Zaabal, Egypt
ENG strong carrier, fairly low modulation, woman announcer
"Radio Cairo presents...", short interlude of Middle
Eastern sounding music, then talk by man, in the clear

9479 WTWW 2010-04-14 2159-2201: Lebanon, Tennessee, USA
ENG fairly weak, just caught two mentions of "Worldwide
Broadcasting" during top of the hour ID by man after
religious program. Heavy local noise. Station actually
voluntarily moved to this nonstandard frequency so
it's 16th harmonic wouldn't interfere with the local
school bus dispatcher!

9265 WINB 2010-04-14 2258-2259: Red Lion, USA
ENG Very strong, but with some audio hum, heavy
modulation, just quick ID exactly at tune in, "World
International Broadcasters station WINB, Red Lion,
Pennsylvania The United States Of America", by man

9370 WTJC 2010-04-14 2259-2301: Newport, USA
ENG Fair in heavy noise, end of religious organ music
program and ID by man as "WTJC Newport North Carolina"

9890 Voice of Russia 2010-04-20 *2158-2206: Krasnodar, Russia
ENG fair/alone on new frequency to North America, open
carrier and test tones of approximately 1 kHz before the
hour, international news read by woman, most items were
about Russia and Putin, ID by man as "Voice of Russia
World Service" after news and short instrumental musical
interlude

9735 Deutsche Welle 2010-04-20 2135-2138: Sines, Portugal
ENG fair to good, in the clear with the end of a news
report by man and ID. Gone at 2159 recheck.

9870 BSKSA 2010-04-21 2136- 2202: Riyadh, Saudi Arabia
ARA fair, alone but noisy, woman reading poem (as
identified by my friend Fayez al-Herz), came back just after top
of hour to find man and woman reading, probably news. Much
louder the day before (when this was suspected.)

9420 Voice of Greece 2010-04-22 2156-2201: Avlis, Greece
GRE fair/good, Greek music and talk by man, then "Ain't No
Sunshine" Bill Withers tune up to top of hour, ann by
woman, heard "... Helladas", presumed news read by man

17775 KVOH 2010-04-26 2151-2203: Rancho Simi, USA
SPA strong but with deep fades, Spanish religion
(apparently not brokered), mentions of a church or an
address in Los Angeles, many mentions of Restauracion,
possible mention KVOH at 2201 but definitely no legal ID

9440 China Radio International 2010-04-30 1151-1154: Kunming, China
NAN/CHI fairly strong, listed in Chaozhou but definitely
speaking Mandarin, possibly for sign off announcements by
man, mention chinaradio.com

9700 Voice of America 2010-04-30 1156-1200: Udorn, Thailand
IND good, talk in Indonesian by man, many mentions "VOA",
nice clear signal

9760 Voice of America 2010-04-30 1205-1210: Tinang, Philippines
ENG good, news in English read my man, mention "VOA News",
still going strong at 1235 recheck with more news and
mention VOA

9695 Radio Japan 2010-04-30 1224-1231: Yamata, Japan
ENG/THA good, "In Focus" culture program hosted by man and
woman, traditional music, then quick mention that it is
the end of "Radio Japan in Focus" directly into presumed
Thai at 1230

11550 WEWN 2010-04-30 1501-1503: Vandiver, USA
SPA strong, phone number and other announcements in
Spanish, gave URL including wewn.net

9410 BBC 2010-05-04 1204-1206: Cypress Creek, USA
ENG full-strength, news about the attempted car bomb in
New York City, ID by man

11860 BBC 2010-05-04 1244-1246: Montsinery, French Guiana
ENG good, BBC news items being read by a woman, ID

6020 China Radio International 2010-05-05 0052-0055: Cerrik, Albania
ENG fair, second loudest European on band (Spain 6055
slightly louder), end of music program, URL read by woman
ending in cri.com, intro to program "Women yao xue hanyu"
(We want to study Chinese)

6150 Hungarian Radio 2010-05-08 *0057-0104: Jászberény, Hungary
HUN fair, open carrier from tune-in, three second long
high-pitched test tone at 0057:55, open carrier to sign
on at exactly 0100:00, muddy/bassy audio, announcement by
man, short band music then presumed news read by man;
decent signal and alone, would be readable, if not for
mushy audio. Get this one while you can-transmitter
site switches to Germany at end of June, leaving
Hungary off shortwave entirely!

5954.2v Elcor Transmitters 2010-05-08 0044-0056: Guapiles, Costa Rica
SPA Presumed transmitter manufacturer equipment test
suffering severe ACI from both 5950 and 5960, fair signal
with deep fades, playing one Shakira song after another,
all early (Latin American) hits from the 90s: "Ciega,
Sordamuda", "Ojos Asi" etc. Glenn Hauser reported a
carrier here, on May 2 and similar Latin vocals here
tonight.

9615 Radio Veritas Asia 2010-05-10 1153-1157*: Palauig, Philippines
CHI/ENG surprisingly strong and clear, Mandarin discussion
by man, short orchestral music interspersed with
announcements, few seconds of silence then slow, clear
English ID by woman "Radio Veritas Asia... Philippines...
.935 megahertz..." and carrier cut. Probably referring to
switch to 11935 at 1200.

9595 Radio Nikkei 2010-05-10 1157-1202: Chiba-Nagara, Japan
JPN fair, would be excellent if not for strong Cuba 9600
ACI, nonstop woman talking in definite Japanese, some
pauses and pips at the hourtop, into presumed news also
read by woman

73 from St. Louis

Excellent thread!

Gives an idea that these radios are passed rather quickly through the assembly line and a simple "goof" can be missed! Eton may have the same problems...

2583. DE1103 with me on our trip....

Yahoo group: de1103
Date: 2010-06-20 11:28:25 UTC
From: kb8dns
Topic: 2583 Message: 2583

Out and about for a week, down to Nashville, Tennessee then on to Columbia, South Carolina and home again.... Fun trip and more so with several short wave radios!
My DE1103 is working great and reception is clean and practically noise and interference free. Our motel has many of those energy saving lights and I can hear them on all the receivers.
I brought along my Degen DE1103, Grundig G3, Eton E5 and the Kaito KA12AIR. I plan to do a few videos and post them on my You Tube account. So far all radios have been doing very good but my G3 is a bit off. I think the heat may affect the SYNC, in the mid nineties here! The little KA12AIR does a fine job with it's reception of the AM aircraft band.... No user's group for this radio yet!

More to follow! 73 es gud DX! Rod KB8DNS

I don't know why Rod but your description of your shortwave radio sojourn made me think you are a perfect candidate for working FM satellites with a dual band HT and a handheld yagi. I can't explain why I got that impression- sorry for the off topic digression. I love my degen too. 40 meter SSB is amazing. I hear this guy from Milan, Italy nearly every night off the whip.

Hi John!
I did have my Yaesu FT50R with me but the trip was half business and not much concentration for amateur radio. I do agree that it would be great to work satellite portable! My Degen worked very well for me! I had bought it from an Ebay auction and had to repair the FET front end, I used a MPF-102 and had to thin it out to fit but the repair worked fine! I have at least one You Tube video with it.

2587. My Degen

Yahoo group: de1103
Date: 2010-06-26 13:15:23 UTC
From: Oliver
Topic: 2587 Message: 2587

Hello folks. I've had my degen for nearly a year now, and of course I love it to pieces. I've had Australia, Japan, Several stations from South and Central America on the HF bands, just with the telescopic antenna. I've had mine modified for BandII (FM Broadcast), with the old filters being taken out and replaced with 2x 80KHz, obviously improving selectivity. I had a play with my friend Julian's Degen which prompted me to purchase my own, and now my friend Richard has acquired one.

Now, already, Richard and I have noticed a few differences between his Degen and mine. Mine seems just a little bit more sensitive on the HF bands, not by much, but noticed on weak stations in the noise. on the other hand, mine has always warbled if not held still, and his doesn't at all!

I always thought that was a downside of using a £50 receiver from HongKong, but clearly, after doing some research on the internet, no-one else seems to have that problem. I thought it was standard, like the 'blip-blip' whilst tuning of which I can live with.

"Can I eliminate this warble?"
its fine when theres no vibration.

and also

"Can my friend's Degen be 'tuned-up' to perform like my degen?"
He's optimistic that his Degen was probably the last one of a batch made during a particular day, quickly put together and not properly optimised etc.

Great group by the way, it's nice that we can share our experiences with our radios!

Thanks
Oliver.

With a 'simple' whip on lower bands you would receive mostly noise, particularly indoors.

Why don't you try a simple loop like:

http://ik4hdq.net/doc/testi/smlloop.pdf

I've made one and it gives really good results indoors.

Check if your 1103 works with external antenna on the LF.

I am able to receive several AIR beacons on my 1103. I believe the radio bypasses the whip at these lower fos and the ferrite rod comes into play. I think a loop antenna would do much more for reception!
Here is a link to an excellent homebrew loop!

Please take into account that the "antenna in" jack won't work for MW or LW. Yes, using the famous keystrokes you can cheat the radio into tuning below 100 kHz AND enabling the "antenna in", but it seems the internal ferrite loopstick is disengaged and sensitivity for LW and MW drops dramatically. I think it would need a very good external antenna to overcome the sensitivity loss caused by losing the ferrite. But probably a good external loop would be useful.

Regards,

Moises

Hello all,
I just received my new DE1103, I will be testing it tomorrow evening when I get home from business trip.
Can somebody confirm what I understand: The bandselector AM+ is used to select a band but when you hold it for one second it starts scanning in that band?
Thanks for helping me out on this one!
Bruno

Hi Bruno,
Yes, holding down band(+) will scan up in frequency on the band the radio is on; holding down band(-) will scan down in frequency on the band the radio is on.

Hallo Bruno,

Use or buy 4 new fresh akaline battery's type AA 1,5 volt akaline and
see what the result is.

The 4 rechargable battery's in the package needs to charged before use and are low in quality.
The power adaptor is not controlled and charging the battery's
in the DE1103 is risky.

I bought a charger by Conrad a Ansmann Energy 8 (type's of battery's).
Handy for all my equipment e.g. camera, pre-amp, Sony receiver, calculators etc..

Enjoy the radio, it is a nice little thing but needs carefully treatment.

Hope it helps a little..

Regards:
jan

Hallo Bruno,

Use or buy 4 new fresh akaline battery's type AA 1,5 volt akaline and
see what the result is.

The 4 rechargable battery's in the package needs to charged before use and are low in quality.
The power adaptor is not controlled and charging the battery's
in the DE1103 is risky.

I bought a charger by Conrad a Ansmann Energy 8 (type's of battery's).
Handy for all my equipment e.g. camera, pre-amp, Sony receiver, calculators etc..

Enjoy the radio, it is a nice little thing but needs carefully treatment.

Hope it helps a little..

Regards:
jan

Could be a cold solder joint on the board. Might be worth it to check, unless the seller is covering return the shipping cost.

Thanks for your advice Nelson, I really appreciate it. The seller is sending me another DE1103 in advance, before I return mine to him...so I accepted this deal!

Kind regards,
Bruno

OK Bruno,

Please, let us know how all the things works out.

BTW at the backside of my DE1103 is a whit little sticker
that says "QC PASS"'.
That mentioned that a Quality Check is done.

You have to check that.

Kindly Regards:
jan

Jan,
On my DE1103 there is NO qa sticker, maybe they did NOT check it...well anyway, I am gonna get a new one from my eBay seller!!!

Apart from the lighting problem I am very satisfied with Degen 1103: Selectivity and sensitivity much better than my Sony!!!

Hello Bruno,

My Sony ICF-SW7600G is a nice radio ... LSB / USB switch and a "Sync" feature.
I use the Sony for DX-ing when on holiday.
The DE1103 is for receiving weatherfax, mmsstv etc.

Connecting the Sony audio to the laptop is in my case not pleasant.
Groundloop maybe.
The DE1103 gives no problems.
A 1:1 audio transformer will do the trick for both I think.

Kindly Regards:
jan

Most likely that the reason WHY that specific 1103 didn't have the
QC PASS sticker was because of the dead LED lamp.

You should have asked the seller if they will willing to let you keep it for 1/2 price.
Since shipping is pretty expensive.

Bill

one of my friends bought a resold DE1103
it was the same case of LCD back-lit design failure
if asked, many would come back with a similar situation. perhaps owners are not much bothered as, otherwise, they are performance oriented.
On an analysis, if the schematics are to speak, the Back-lit circuitry appears defective and transistor Q29 is very likely to fail

due to current through LD2 and LD4. they are directly connected and limited only by the 10 ohm emitter resistor, as against LD1 and LD3 that have a 200 ohm series resistor. I definitely see a flaw here.

Just looking at your post, Oliver. You are asking about two problems

Richard's 1103 has reduced sensitivity on HF. There are few stages in the 1103 which need adjustment, unlike simpler radios - only the IF stages have adjustable coils

My first thoughts are about the aerial pre-amplifier stage, which is only used on SW, and would be
damaged if he touched the telescopic antenna while charged with static. Can you make a comparison
between the two 1103's using a short EXTERNAL antenna on the SW bands? And how do they compare on MW
(using the internal ferrite antenna)? If they differ only on SW using the telecopics you should be
looking at the pre-amplifier and its YJ-7 (2SK2394) J-FET

Oliver's 1103 has an audible 'warble' on SSB when moved about, and I would first suspect the 2nd
conversion oscillator. Can you listen to the oscillator on a scanner with CW or SSB? Listen on
55.395MHz
(?1kHz) and see if this shows the same warble. You could also listen for the 1st LO at 55.845MHz
above the received frequency but I do not believe this will be the problem. If it's the 2nd LO you
will have to look for mechanical weakness inside the tin enclosure for the oscillator, which has a
spring soldered on top to contact the screening card above it. Maybe the coil tuning core is not
secured tightly and would benefit from a little glue?

- Julian

Oliver [oliver_wakefield_dxer] wrote:

Richard and I have noticed a few differences between his Degen and mine. Mine seems just a little
bit more sensitive on the HF bands, not by much, but noticed on weak stations in the noise. on the
other hand, mine has always warbled if not held still, and his doesn't at all!

"Can I eliminate this warble?" its fine when theres no vibration.
and also

Hello Degen group,
I have now received a replacement radio DE1103 from Shanghai and now all lights work!!!

One question: Is it normal that the lights stay on all time during battery recharging process, even when the radio is turned off? Or should I manually shut down the lights (using the switch) during recharging the batteries???

Thanks for letting me know,
Bruno

Topic: 2587 Message: 2609

Hi Julian, thanks for the reply...

I have done the oscillater tests with my degen and I have found that listening on 55.395MHz on my Icom 706 in CW mode, there is no warble effect at all. Afterwards, I put my degen onto 4MHz and tuned my Icom to 59.845MHz and the warble effect WAS present there!

I've yet to visit Richard's to conduct the other tests, however another thing I've remembered is that my degen works fine below 100KHz. I can hear the time signals clearly with the other data modes etc. On Richards, there is alot of noise below 100KHz and nothing is really listenable down there.

From what I remember with his degen, on MW using the internal ferrite antenna, it does work but it did seem noticeably deaf compared to mine. Over-riding the ferrite and using the telescopic did improve sensitivity on MW, like it does with mine, but again, still deaf in comparison whilst I was listening to the same station using the telescopic on mine. I believe it was a simular experience using the supplied external wire although I'll have to double check as its been a while since I was last at his.

Cheers
Oliver

2610. Lights stay on during battery charge

Hello,

Is it normal that the LCD-lights (orange) stay on during charging of the batteries, even when the radio is turned off?

Thanks for letting me know!

Bruno

You can still use the switch on the side to turn them off though, so they don't have to stay on for hours.

2613. Your vote is important... to "save" the kaito-de1103 group...

Yahoo group: de1103
Date: 2010-08-17 11:04:01 UTC
From: gvastianos
Topic: 2613 Message: 2613

Hello happy 1103 users

Iam SV8GXC (gvastianos), ham operator and 'proud' owner of a modified 1103 receiver.

All of you that you are members of yahoo groups you may remember the "kaito-de1103" group that was the main source of info about the 1103s from years 2004-2006 BEFORE the creation of this group "de1103"

The sad story of "kaito-de1103" group goes like this:
The owner started the group maybe as joke in early 2004, he posted some messages only in the first 15 days after the creation!!!!! he moderated the group for some months and after that he lost his interest about the group and turned it to unmoderated in all levels...

Because of the success of 1103 receivers from degen and kaito... the group became a bit of popular (868 members now) and many messages exchainged between members with very usefull postings

Many months after the group draw the attention of some spammers that took the chance to penetrate the unmoderated group and start to post inapropriate spam-adult content...as messages or images inside the files section.

Of course the absense of a moderator turned the usage of the group uncontrollable and sood it was categorized from a "Shortwave" group ... to an "Adult" group...AND LOST ITS FIRST AIM TO BE SOURCE OF INFO ABOUT 1103s..

At the end the search for info inside this group became quite difficult as the members should search inside of tons of spam "trash"

SO FINALY leon_heller who is a HAM took the responsibility to start a new Moderated group "de1103" THIS GROUP and solved the problem (BRAVO leon!)

==========

Even that the problem about a group dedicated to 1103s it is solved by the creation of this group,

the old kaito-de1103 group contains usefull information that is hidden inside alot of spam garbage & the group is completely orphan and uncontrollable to spam because the group owner left it

==========

WHAT IAM TRYING TO DO??????????

After hours of checking the content of the kaito-de1103 group...from the beginning until today

I WAS ABLE TO LOCATE ALL THE SPAM IDS AND MESSAGE NUMBERS AND FILES THAT INCLUDE INAPROPRIATE CONTENT...AND IT IS A MATTER OF A COUPLE OF DAYS WORK TO DELETE THIS STUFF AND

TURN THE GROUP TO ITS PURE-CLEAN STATUS...BUT IN ORDER TO DO THIS I NEED MODERATOR RIGHTS...THAT ONLY YAHOO MANAGEMENT TEAM CAN GIVE ME / SINCE THE OWNER IS COMPLETLY LOST...

After an email to the Yahoo Groups management team they told that they can give me moderator rights only if I create a poll inside the group for one or more weeks and let the members of the group to vote me as moderator. The IDs of the members that will vote will be kept in log and after the end of the voting the management team will check the results and will give me moderator rights.

IF I GET YOUR VOTES AND BECOME MODERATOR... I will delete all spam and clean the group from bad stuff in order to make the search on the OLD usefull info EASY. After that I will make unmoderated the membership in order new members to be join automatically and i will block new postings / and file uploads. MY GOAL IS TO FIX kaito-de1103 group AND MAKE IT USEFUL ONLY FOR SEARCHING INSIDE THE OLD USEFUL INFO EASY....IT IS NOT TO HAVE A GROUP THAT WILL RUN IN PARALLEL WITH THIS GROUP...THERE IS NO REASON FOR THAT..

If you agree with my goal and you want to help me.... JUST VOTE to save the old kaito-de1103 group!!!

Just fyi...

This is not happening to only DEgen 1103 group but to others too.

The PBCskywarn group was infiltrated by adult advertising namely
biker girls...i reported this to yahoo and complained..to them. I hope
biker girls gets the caught for illegal hacking and spamming!

They know who they are and they are going after them.!

Yes, I will vote. Curious though ... how hard would it be to simply download the best info from the old group and re-post that info to this group? Maybe easier than deleting all the porn from old group, then having to search this and that group for info? Could we have everything in one place?

Mark

Mark:

Your idea is very good.

Perhaps, cut & paste all info from old group to a document and then
upload it to de1103 group.

Sorry for my english!

Federico Ch. Tomasczik

>

Excellent proposal, George, and I like the idea that you will not run the old group in parallel with
this group, as we do not need any more groups for posting about the 1103! I have re-joined kaito-de1103 and voted.
Now would someone like to do the same with DegenKaitoTecsunGroup?

I rejoined and voted, soon I will go back and remove myself. I like the idea of making one group!
Transferring everything will be no small chore as I had gone through something like it when I rescued all my files from Geocities when they closed done here in the USA. George, if you need help let me know as I can help a bit. Let me know if you would like help with the links, files or photos.

2628. GOOD NEWS... the kaito-de1103 groups is clean...

Yahoo group: de1103
Date: 2010-09-04 08:06:32 UTC
From: gvastianos
Topic: 2628 Message: 2628

On 1st of Sep after the poll for voting me as administrator of kaito-de1103 was closed with 98% yes. Yahoo support team reviewed the results and gave me full administration rights.

Since that day it took me 2 days to clean completely ALL the spam and adult content (messages, pics, files and members who posted spam)

In the process of cleaning I removed also all messages referring to the spam problem,,,and also replies from members to spammers.

Now the content is like "no spam were never existed"

I personaly reviewed all the content from message number #1

After that I posted to Yahoo Support Team to review the content of the group and return the group from "adult" to "shortwave" category

The group passed all the non-adult tests and now is moderated,pure, spam-free and belongs to "shortwave" category as before

http://groups.yahoo.com/group/kaito-de1103/
just gained back its virginity.....

CURRENT STATUS:
MODERATED, NEW MEMBER JOINS AUTOMATICALLY, NO NEW POSTINGS / UPLOADS ARE ALLOWED FROM MEMBERS...

IT EXISTS ONLY FOR HISTORICAL PURPOSES..YOU CAN JOIN TO IT AND USE IT TO SEARCH IN THE ARCHIVE FOR USEFULL INFO ABOUT YOU FAVORITE 1103 RADIOS...

You deserve a vote of thanks for sorting it out. If nothing else, I
won't have to keep adding a message pointing people to this group,
although the spam seemed to have become non-existent over the last few
months.

You could add something about this group to the description so that
people can find us, and explain why new posts can't be made.

I just wrote them explaining the situation and also mention that I have done work to locate and log all the adult sp-m content in the old group ... so it was only the moderator rights in order to save the group. Then they replied that they believe that I have good effords BUT I need first the trust of the members via a poll in order to vote me as moderator.

I have already changed the description of the old group and included a link for this one...

Also thanks for your trust to make me co-owner of this group. You will have my help when you need it..

From: syfr
Topic: 2635 Message: 2635

What kind of batteries are people using and what say,is the run time of a 2300mAh supplied radio?
Also, if you're using NiMH cells, do you find the charging circuit in the radio useful, or do you externally charge?

Many thanks
John

2636. Re: batteries

Yahoo group: de1103

From: danny.parkinson
Topic: 2635 Message: 2636

Hi,

I've found that using 2100Mah 'Instant' NiMh batteries are the best option as they don't self discharge unlike normal rechargeable batteries
and thus last longer if the set is left for some time.
Many compaines including Vapextech & Energizer make these special
types of batteries.

I use the built-in charging function if I have spare time on my hands - usually overnight when the unit is not in use. I usually externally charge the batteries with a 'smart' charger as its the best option to prolong the battery life & quality.

Hope that helps,
Dan.

You charge the batteries for 24hrs? Are you overcharging them?

You should only have to charge them for about 14-16 hrs. Depending
on the milli amp rating.

I use the duracell 2650 mah rating excellent nimih batteries. I use a
seperate charger with a light that tells me when they are charged.

I always have an extra set to swap while i recharge the ones I take out.

Paul.

Hello Tao

Remember me?

from Palm Beach Gardens Florida I ordered the degen 1103 last
year or so its still working very well//I have been happy with it!
I use 2650mah duracell nimh batteries..excellent ones..thats
the highest they make for mah ratings.

Any newer versions coming out?

Hi Paul,

Nice to meet you at here!

So far there is not any new upgrade on the de1103 radio, the last version continued for two years already...-:)

I use two sets of NiMH batteries, and charge them externally, swapping them when they become discharged.

Vapextech are now making some 2900Mah batteries of which
I'm shortly gonna get a set to use in my Degan.

I've been using both the 'Instant 2100' batteries that thay
do and the previous 2500Mah standard NiMh batteries that they
have.

Has anyone else had RFI problems when connecting a laptop
PC to the line-out?

I cannot seem to cure the problem and it is causing a major hassle
when trying to decode WEFAX broadcasts. I've acually resorted in using
a small FM tranmitter that you would use for an MP3 player, connecting
that to the line-out and rebroadcasting on a blank FM frequency
and using a standard FM radio plugged into my laptop's audio
input. This works and seems to cure the problem but I would like
to find if anyone can help with a more suitable cure so I can
just plug the laptop into the radio's line-out.

BTW, those ferrite coils added to the wires do not work!

Yes,,

In the past i used that for isolating the buzzzesss and hmmmm when i use to use the wefax and rtty using the degen and serial port interface.

Wefax is very limited now..i use to like the us navy wefax but that went out a long time ago.. They never shud have gotten rid of it.. They should bring that back online..I remember teh transmitter use to be in norfolk and then moved to maine..after wards they went off the air..I think they may still do it as back up or on demand..the one that is good now is the coast guard boston and louisiana wefax stations and the ukmet wefaxt station.

Rtty the canadian station metoc and ukmet 45 baud rate..slow but at least fewer errors.. it would be nice if they switch to FEC mode error correcting for text weather data hourl obs upper air etc..

Topic: 2635 Message: 2652

Hi John. I am using Kodak (precharged) 2100mah NiMH batteries. I charge them in the radio, and they last 24-27 hours on a charge. These batteries are hard to find now, so for my digital camera I use Rayovac (8x) NiMH batteries. They are working well so far.

Never use any charger that runs the batteries all the way down before charging, as this can dammage the batteries. Also never let batteriws sit in a (nearly) discharged state. This can shorten the life of the batteries.

ttyl.

We still have a good WEFAX service in the UK from
GYA Northwood on the following freq's

2618.5 (2616.6) kHz*
4610 (4608.1) kHz
8040 (8038.1) kHz
11086.5 (11084.6) kHz
18261 (18259.1) kHz*

* = Not 24 Hrs

I use 4608 with good results.

You might pick these up if the skip is good!

At least The Uk thinks of wefax being an important service to the
people of England.. In the U.S. here the politics on these services
is a waste of time and money.

Then they go on and say we believe in services to protect life and property.

Don't count on it...
I don't think weather fax will be around forever
it just seems that in both the UK and Germany
the service is still good although our UK service
does not broadcast all the time, they only turn on
the carrier when the fax is about to be transmitted
(to save power) wheras the Germany signal broadcasts
a constant carrier even when no signal is being recieved.

I can recieve both here in Cambs,UK although the German
signals are strong in the evening and night as opposed
the the low to average signal I can pick up from Northwood
UK's service.

I use the maps mainly for reference as they are far more
detailed the usuless maps we see on TV!

Is it possible the noise is coming from the unswitched (I assume) laptop power supply?

Disclaimers: I have entered into no agreements regarding mails erroneously sent to this address, and reserve the right to do as I wish with any such emails.

take a 1" toroid, pass the audio cable, at the PC side, thro it, 6 to 7 turns and then connect

this would help reduce noise.
this trick I gathered from www.drmrx.org/forum

I must admit that because I have many radios but use some of them infrequently rechargeables are not convenient for me...I stick with alkalines. But when I have used rechargeables, such as for a camara which used AA's, I think teh use of the best smart charger you can get is a good way to go. Radios with manual chargers where you set the charge time seem like a pretty good way to be sure you won't get the most out of the battereis as you will never know when each cell is fully topped off but not overcharged.

There has been from time to time on eBay an isolator which many users report cures this...I couldnt find it when i looked just now. I suspect it maybe a transforme isolator to block RF but pass audio.

Correct as i said before it is an isolating transformer...the specs
i think is a 1:1 isolating audio transformer 600ohms:600ohms.
Input output..radio shack makes it as well as others..which to me
is surprising as to why manufactures dont put a integrated audio
filter on the output side of the degen for using external amps pre
amps etc..to audio devices to be used..

I am using the Eneloop AA batteries. They seem to last longer than other NiMh cells in my DE1103. I invested in the Maha/Powerex C9000 smart charger. It does bring back NiMh cells from the dead, though it takes a very long time-about 50 hours.

Good NiMh cells, trickle or smart charged, can last over eight years in service. If you use a fast charger, it will toast your batteries.

Two of the batter programs I found are;

WXSat which is free but is a pig to first setup &
JVComm32 which is a great piece of software but is shareware
so there is a charge.

Also, please check the net to make sure what WEFax services are
available in your area and as I've already been advised, get an audio
isolation transformer or ground loop remover to connect between the
computer and the line-out of the radio.

2671. Re: Battery charging

Yahoo group: de1103
Date: 2010-09-21 17:38:19 UTC
From: gmcjetpilot
Topic: 1966 Message: 2671

This may sound stupid, no offense, but is it possible you are not setting the charge time? You have to follow the manual, and use the joggle wheel to set hours of charge. (about 10 hrs on totally depleted batteries. I recommend only charging fully discharged or depleted batteries.) The manual has detailed info, procedures and cautions in the Manual. Here are some of the main steps off the top of my head.

-Wall wart plugged in wall and radio
-Radio OFF
-Press and hold SEL button
-Use Joggle to set hours (9 hours is a good start)
-Once it is charging you see battery icon flash
-You can turn radio on and use it on wall wart power
-If you want to see remaining charge time press hold VOL
-Do not charge fully (or partially charged) batteries
-Of course no alkaline

There is a page or two on charging. You should review it.

The internal charger is a DUMB charger but works great. I say dumb because it is NOT automatic. It works on TIME (you set) only. So you have to do the math**. Over charging is worse than undercharging. "Real" stand alone chargers have Delta VOLT, TEMP monitoring to shut the charge off automatically. Some have fancy "programs" that change the charge voltage, cut back and than go back up to handle some particular issues with charging NiMh. There are books on the subject. All you need to know is the 1103 Charger DOES WORK..... You just have to estimate charge time and set it.

There is something wrong. I use the charger and it works great. For the record I run it until it shuts down automatically from low volts. I get about 7-9 hours of operation. I tried to time it but they way I use the radio that is a month or months. I do think it is important to drain the battery before charging. NiMh is better than NiCd was for "memory" but NiMh still does benefit for "conditioning", aka discharge before charge. Some chargers do this automatically or with a button.

** Battery math:
The manual says to take the rating of the battery in mAh, say 1300 mAh and divide by 100. You get 13 which is charge time hours. I recall they come with this size. I personally don't charger them a full 13 hours ever. I charge 10 hours, may be

11 hours. That is all they need to come up to full voltage. You might shove a tiny bet more of electrical power into the battery, but I find all charged NiMh batteries drop a little fast in the first hour and than levels off. That voltage is set in the chemistry of that particular battery. Almost every make, brand, size of NiMh I have, will have different final charged voltages. Some are only 1.38 volts (my weaker NiMi) and some 1.45 or a tad more, may be 1.48 volts. You will never typically see 1.5 or 1.6 volts on a NiMh like you don with fresh alkalines. Most important is what voltage it is in the first hour and than the 4 or 5th hour. It should remain fairly flat.

I charge ~10 hours. The idea is drain fully (or as fully as the radio allows which is below 1.2 volts per cell). Not when the radio shuts down the voltage of the cells will be about 1.21 volts. If you let it sit, they recover to something under 1.30 volts. Turn the radio on with in a minute to five minutes the radio will shut off.

10 hours is about right, 11-12 hrs tops. I know the 1103 charger is sophisticate. It is dead simple and has no self timer, temp, Delta Charge rate voltage monitoring like ANY good NiMh charger.

While I try and discharge the radio fully, and the batteries go kaa-put and still need to run the radio on battery, I do have a spare set (I have about 28 NiMh AA's and AAA's). I use two external chargers if needed. I did some tests, comparing charging between my different chargers and the 1103 internal charging. I did some test and found that 10 hours was a good charge time. At some point during charge there is diminishing returns and you just heat the battery and reduce it's life.

As far as your problem I can tell you the charger when used with care is super covenant and works great. The built in TIMER is great, but you have to set it with care.

Cheers

Hi Tao,

That is what I think too. I just asked as some reviews and wording on blogs, reviews online mention memory scan...I will try and search around more for details. At this stage I find little point using memories, not that I need to have them, it is a "throw around radio"/backup radio.

Robb.

Just tried an isolater with no joy, and the RF intererence on the
shortwave bands is all over the show now, even without the PC Connected to the line-in.

The best bet is still to put the radio out in the bottom shed, run a long line away from
the house and use an FM modulator to re-broadcast to the house.

Seems I've found someone has a power-line network nearby - damn things
should be banned!

I can at least get a good picture from Northwood on 4607 SSB (4610)

I understnad that there are PLCC and power distribution metering info transfer data systems that work on power lines. these cause heavy interference. these things are reported from UK and some European nations. You know ell that many other sources of disturbance are there right in the home , like CFL, Fan regulators, ISDN lines, etc.
possibly no cure unless the concerned nations change the frequency band of such , to higher slots.

thus I feel that Rx placement and antenna Height with sue shielding, and isolated working (without using charger), and use of toroid based audio cable filtering can help to manage such interference (though you fell that such things did not work).

If you are in the UK check out the QRM UK yahoo group - they are trying to get these devices thrown out.

You can make a complaint to Ofcom (the UK regulating body) who should investigate and can have them removed/replace with wired connections.

See http://tech.groups.yahoo.com/group/UKQRM/?yguid=81039924

Disclaimers: I have entered into no agreements regarding mails erroneously sent to this address, and reserve the right to do as I wish with any such emails.

I have (oddly enough) done some tests with the Degen and found that the CFL's that I use do not create any noticeable RFI, I use mostly Philips Genie and some GE bulbs. I also have found the striplight we have in the kitchen is noisy, but not overpowering.

I do, however have a shed light that has a 9w CFL which runs on 12v and that is a noisy thing RF wise!

I cannot find anyhing in our house, other than the laptop power supply and a smart battery charger which uses a switching mode PSU, which generates much local interference.

If I take the radio for a walk and go to a nearby house, there is a loud 'buzzing' sound which distorts and blocks most frequencies right from 3Mhz right upto about 27Mhz so that must be one of those bloody powerline networks.

I

I understnad that there are PLCC and power distribution metering info transfer data systems that work on power lines. these cause heavy interference. these things are reported from UK and some European nations. You know ell that many other sources of disturbance are there right in the home , like CFL, Fan regulators, ISDN lines, etc.

possibly no cure unless the concerned nations change the frequency band of such , to higher slots.

thus I feel that Rx placement and antenna Height with sue shielding, and isolated working (without using charger), and use of toroid based audio cable filtering can help to manage such interference (though you fell that such things did not work).

2684. Degen 1103 compared to Sony SW30 SW55 SW77

Yahoo group: de1103
Date: 2010-10-09 17:18:46 UTC
From: bruno geuth
Topic: 2684 Message: 2684

Hello,
Has anyone ever tested the Degen/Kaito 1103 against Sony SW receivers like SW30, SW55 or SW77?
If so what was the result?
Technology is quite the same, Sony also uses 1st IF at 55845 Khz and 2nd at 450...very comparable if you ask me...

Thanks for letting me know!
Bruno

Hello Bruno,

Tough question to answer, it depends on what your requirements are. See reviews below.

 reviews of DE1103 http://www.eham.net/reviews/detail/4288?page=1 and http://www.radiointel.com/review-degende1103.htm
 reviews of SW77 http://www.eham.net/reviews/detail/480 and
  http://www.radiointel.com/review-sony07-77.htm

Kind Regards,
Gil

I know this reply is a bit late but I'll bet other people have been caught this way ----

I've just got the DE1103/DE31MS combination. I had the same result - the DE31MS didn't do anything. THEN - I realised it was connected the wrong way round. That is - the short lead from the control box was plugged into the loop, and the long extension lead connected the radio to the control box. WRONG !!!

The control box (short) cable plugs into the radio. The long cable connects the loop to the control box. Now - it works very well indeed. I should have read the instructions a little more closely....

You also know for AM radio the Antenna JACK does not work with MW.... UNLESS you do the "TRICK" or Hack. You can always use the inductive coupler coil to passively boost the signal to the internal ferrite loop stick antenna. However if you dial up to 1711 than use SCAN (band down or minus) and let it seek into the MW band the antenna will remain on the antenna jack and not the loops tick. Than you can use the DE31MS loop direct for AM MW BCB.....

Yes - I found the hack thanks to this group ! The DE31MS works well on MF in this mode . No need to use the ferrite bar coupler.

Also - I've found the VLF performance of the receiver is quite surprising - I can hear signals all the way down to 18KHz. This needs an external VLF active antenna, though.

2691. wrong frequency display

Yahoo group: de1103
Date: 2010-11-29 10:44:14 UTC
From: BIOMET
Topic: 2691 Message: 2691

Hi fellows :

I have a degen 1103 who has this problem:
It shows the frequency with a +15 khz drift, let me explain better when I tune the radio who broadcast in 600 khz but the radio display shows 615khz.
Its only happen in LW, MW, and SW, but in FM the frequency are correct
any advice or solutions to share?

thanks in advance

Jorge

2692. Re: wrong frequency display

Yahoo group: de1103
Date: 2010-11-30 11:03:46 UTC
From: Julian Hardstone
Topic: 2691 Message: 2692

Jorge - There are known problems with the 2nd Local Oscillator on AM. Do you have any other symptoms? If you tune an AM station with the tuning knob (in 1kHz steps) is the tuning correct? Try
it also in SSB mode and check that the beat note changes correctly in 1kHz steps

The 2nd LO should be 55 394.5kHz for even dial freq's and 55 395.5kHz for odd dial freq's. You may
be able to check this with a scanner receiver. If there is a problem it will be necessary to adjust
the oscillator

- Julian

2693. DE1103 S-Meter Fault

Yahoo group: de1103
Date: 2010-12-04 19:18:50 UTC
From: radioshedtw
Topic: 2693 Message: 2693

Hi, I have a new DE1103 (purchased from Ebay around 1 month ago) which works fine apart from the S-Meter which has faded until it can only be viewed with the set almost horizontal, and even then the contrast is low. The rest of the LCD display is fine, it's just the S-Meter which seems to have changed it's 'viewing angle'. This also is the case when the meter is acting as the battery level indicator. Not a massive problem as the meter is not hugely important to me, but I'm interested if others have this fault and a possible cure.
Thanks
Ian.

2694. Re: DE1103 S-Meter Fault

Yahoo group: de1103
Date: 2010-12-05 14:12:49 UTC
From: Greg
Topic: 2693 Message: 2694

Mine is several years old and there is no problem. I don't remember is there a contrast control? I don't think so but I would double check. Sounds like it could be a bad spot on the LCD display, or loose connection to the LCD display. A connector wiggle could fix it. The LCD mounting has flexed the display? Loosen the mount could restore that corner of the LCD. (These are all obvious wild guessing that could be fixed or checked semi easily).

If a month old contact the seller and see if they take it back, for a trade.

Google: LCD display faded, see if any one has thoughts on this subject. I have read about this subject in the past in general but don't recall all the issues. LCD's are very reliable.

Cheers

I had this happen on a Sangean ATS909. One of the legends on the LCD display faded, but all the others remained OK.
As far as I'm aware, this is due to a poor connection on the line that drives that particular part of the display, or possibly, a failing drive transistor.
In either case, there's not much you can do about it. It's a very common minor fault on consumer-grade electronics.

The elusive S-Meter has now returned, and consistently so.
I spent some considerable time this afternoon and this evening with the DE1103, the meter was back to it's old self. I'm guessing that at worst it's one of those darn intermittent faults or possibly the result of the set being stored in a cold room before use. I have seen LCD displays fade due to low temperatures in the past, odd that it was only the meter segments though. Thanks to all who replied to my posting. Although it's been said many times before, it really is a remarkable set for its type.
Has anyone tried it with the Degen DE31MS active loop, does the '1103 benefit from this or does it create more problems than it solves ?

Many thanks and 73s
Ian.

BTW, Am I only the person who quite likes the volume control arrangement ??

I have seen LCD displays fade due to low temperatures in the past, odd that it was only the meter segments though. Thanks to all who replied to my posting. Although it's been said many times before, it really is a remarkable set for its type.

Hi all,
I have many shortwave radios that I use, so some while ago I got a new Degen DE1103 from eBay.
I was very surprised at how good it is compared to others of the same style.
Now and then I use a Global ATU 1000 and 40` end fed wire antenna for great reception.
But in bed late at night for the short antenna it has it does pick up a load of stations, for batteries sake I use a PSU the original one packed up in no time, no point in sending it back for that.

All in all a great little radio.

Mike.

Hello,

I just received my copy of WRTH 2011 and... surprise !!
After having ignored it for several years, there is eventually a review of the Degen 1103..
disappointingly, it is absolutely obscene ! The 1103 is depicted as being almost useless on all bands, and much worse than the Tecsun PL310...
This is so ludicrous that I must conclude that reviewers at WRTH are incompetent (and I don't believe this) or heavily biased (ads?)...
Whichever is the case, I won't trust their opinion any longer..

73, Mike

BTW, I own and use both of them (and many other rx)

Hi there,
I agree with you, I own a Degen DE1103 and I am very pleased with it.
The SSB mode is clean and clear not a problem, memory storage is plenty
for those channels you like to keep.
Just using the antenna that comes with it I get very good results. A
tape output is also very handy.
I have also gone to other sites and the opinions of others have been
positive rather than negative.

I am disgusted about all the bad things that has been said about the
1103, I know full well this is very wrong.
Far to many people have said a lot of positive things about the Degen
De1103 so why this?

I will not trust any thing again from this one.....

It seems to me that this person just does not like the Degen and its as
simple as that.
I don't like some radios out there but I would not give them a bad press
because of what I don't like.

I think the person is an idiot, the Degen De1103 is a very good radio
and has features I like.

Mike Lee

Incompetent!!!
My Degen 1103 has thousands of very positive reviews on internet, and as à collector I can easily compare it to my other receivers: À very good sw unit!!!

Maybe wrth is biassed by THE lack of adds for this very fine Chinese product...

Two simple questions:

1. Are there any advertisements in the WRHT?

2. Who are the advertisers?

Hi Mike,

If you post a scan of the article to the group, you could of course be sued for piracy, but not if you post it off group to us.

Sure a lot of us would be pleased to have a closer look at this article !

Thanks in advance

Hi Guys. I have read reviews of the KA/DE1103 that were positive about the performance, but the reviewers obviously didn't like the analog display/button layout/volume control. To me these things are just different, and easily gotten used to. What matters most to me is how well the radio works.

I have not bought a WRTH for many years. The main reason is that the time/frequency information is quickly outdated, and all of the info therein is available on the net for free. I guess I now have one more reason not to buy!

Hi
The only negative thing I ever heard about the '1103 is poor

ergonomics. My Kaito 1103 runs great and sits next to the bedside lamp for night time listening. I have had it for years. I had a Grundig G3 that was a piece of crap compared to the Kaito 1103.

Rubbish!

You surely can write it from word to word, if you only mention, that it is merely a QUOTATION of a larger unity. But if you copy the whole book, and sell it for money, THAT is Piratism!

Ask a layer to be sure.

I guessed,that someone would give me that kind of a reply, so I said, "or someone else" (could do it).

I also bought this Chinese receiver, straight from China, and never regretted it, because it is worth many times more! And MUCH cheaper than the US-version, or the one sold in Germany...

Surely my T-T RX340 has many add-ons, which make it a lot more expencive, but it only gives me the same stations as DE1103, but I can manipulate the signal in so many ways, that it is also much more complicated to use... Takes time to get used to study all those finesses of a communications receiver. Is it really worth the effort and plenty of time used?

Best Regards,

Aimo.

Hi!

I have been reading mostly positive emails about the 1103, but there have also been less good thoughts about it, because some people have received bad or even non-functioning products. Some have bought even 2 or more units, which are working excellently well.

It may well have happened to the people at WRTH, that they received one or more "Monday" units with minor performance... Or might they have been too complicated radios to handle them properly?

Anyway, I would like to read more facts, than mere personal opinions about radios, that are sold in millions, because they are so good.

But who can compete with China nowadays, as they have millions of ingenious, highly educated people, who are using the most advanced technology of tomorrow? Just let us wait for the very cheap modern cars, using new methods of energy!

Here in Europe we have 'Sender & Frequenzen 2011' as an alternative for WRTH.
They give a very positive feed-back on the Degen 1103!

Comparing my DE1103 with Panasonic DR28, Sony SW77 and Selena it is a magnificient receiver...

Have a nice Seasons Holiday and Happy 2011 New Year!!!

I have copied the unlicensed very low power (100mW) beacons in the Mojave from central california with nothing but the integral whip on my 1103. While 300 miles isn't great DX on 4.1 Mhz , it's not bad for a portable and a tenth of watt transmitter with very low antennas.

I'd call that excellent performance for $80 (or $280) portable radio.

As the high rating of the PL 310/380 is so over the top, one suspects the reviewer was given an 'incentive' to say good things about this receiver. I have the PL 310 and KA 1103, the PL 310 makes a better paper weight than a radio regardless of the bands in use.

But remember that all the user reviews are subjective and locations vary, any review should be viewed as an indication of how a particular radio performed at the viewer's location at that time.

Example: The KA 1103 was described as a very good performer on FM, I bought mine on the strength of this claim. The reality is that in my location, the radio's performance is abysmal with considerable overload from local stations which makes it useless as a FM DX receiver. As regards MW and SW, it's performance is splendid.

Hi
The only negative thing I ever heard about the '1103 is poor ergonomics. My Kaito 1103 runs great and sits next to the bedside lamp for night time listening. I have had it for years. I had a Grundig G3
that was a piece of crap compared to the Kaito 1103.

I have copied the unlicensed very low power (100mW) beacons in the Mojave from central california with nothing but the integral whip on my 1103. While 300 miles isn't great DX on 4.1 Mhz , it's not bad for a portable and a tenth of watt transmitter with very low antennas.

I'd call that excellent performance for $80 (or $280) portable radio.

Hi Dick...

I was listening from my parents home in Santa Barbara county

Here's some info

http://www.spynumbers.com/USSWbeacon.html

A little dated,but the 4095-4096 beacons are listenable from that part of
the country, try mid afternoon and tune carefully...they're going to beS0
so use the fine tuning in the SSB position and a wire antenna if you have one.

I heard this group with the Degen

http://www.spynumbers.com/USSWbeacon.html

Let me know if you need more info...

Remember,they're 100mW,so tune carefully
:-)

Here in Europe we have 'Sender & Frequenzen 2011' as an alternative for WRTH.
They give a very positive feed-back on the Degen 1103!

Comparing my DE1103 with Panasonic DR28, Sony SW77 and Selena it is a magnificient receiver...

Have a nice Seasons Holiday and Happy 2011 New Year!!!

I don't have a dog in this fight as I have a DE1102 and never bought a DE1103.

Having said that, did the 2011 WRTH have any comments on the DE1102, or is this model now considered "obsolete?"

I also have a Sony 2010 and a Satellit 800 and for really serious listening I find myself using the Satellit 800 most often.

But the DE1102 is a whole lot easier to carry around J

One final question: Anyone have an opinion as to the best rechargeable battery to use in the DE1102? I have several digital cameras and I've chosen ones that use AA's so I can re-charge them and carry spares without having to spend a fortune on a proprietary battery.

What you say abuut a possibly defective unit is true but as a person who writes equipment reviews all the time I don't think it's a good enough excuse. Once one has been evaluating radios for a while he/she should begin to have a feel for what is normal and what is not. There has been so much positive said about the DE1103 and its offspring the E5/G5 over so many years that if I bought one and found its performance to be poor I would expect that it was not right and want to check another unit. One should develop a sense of how a radio should fall within the world of radios such that if a sample performas very poorly one should ahve an idea in advance of what to expect...what is nromal and what is abnormal.

It would seem this reviewer is hopelessly naive or inexpereinced in this class of radios. I suspect honest incompetence rather than advetising-based bias. But that's me. I've certainly seen more incompetent reviews than dishonest ones.

I agree with you, it's a shame !

I have a DE1103 and some others in the same prize class (Sony ICW7600G/7600DS/1000T/SW55, Sangean ATS909, Grundig Yacht Boy 80).

It surpasses all of them in selectivity and in sensivity, in AM and in FM.

The only negative point is that it's a bit tricky to use in comparison to the mentioned ones and that one must get used to it to enjoy its qualities.

The WRTH reviewers must have got a pre-production set or an unaligned one or they drunk a bit too much !

One never knows !

I give a damn about their opinion, my (our ?) own is made up !

For the DE1103: Hip, Hip Hurrah !!!

Anyway, Merry Xmas to all of you

Dominique

Two years ago me and a friend of mine we bought the same drill made in China. My drill went up in smoke (electric motor)) after only 4 minutes of use. The other one is still working perfectly.
I think some Degen 1103 can sometimes be faulty.
The problem is if the defective Degen-1103 goes in the hands of who does the review.
Season's greetings

I have a KA1103 which was working perfectly until one night I turned it on and there was no audio. Period! All bands and volume levels and so forth. Should I send it back to Universal Radio? I don't know how to repair it myself.

2725. Re: [de1103] Dead Audio

Is it dead both speaker and headphones? When you turn the volume up, do
you see the bars increase on the display?

When you turn the say, DX/LOCAL switch do you hear any crackling noise, etc?

John

Hi TomW26@...

I have a Degen1103 which is showing the same problem as yours.
Just noise on the laudspeaker but no signal tuning in all bands, including FM.
I try to resolve the problem by pressing the reset button but not working.
What I have done is remove the batteries for several hours, and replace and it works normally for several days and "died" again.
This has happened to several months, but fortunately he resurrects after the above operation.
If you find a solution to the problem, please send an email to me.
Grateful
Aluizio
aluiziosantos@...

Now repeat all the above now in my language, portuguese.

Oi TomW26@...
Eu tenho um Degen1103 que está apresentando o mesmo problema que o seu.
Apenas ruído no auto-falante mas nenhum sinal de sintonia em todas as faixas, inclusive FM.
Eu tento resolver o problema apertando o botão de "reset" mas não funciona.
O que tenho feito é retirar as pilhas durante várias horas, e ao recoloca-lá ele funciona normalmente durante vários dias e "morre" de novo.
Isso já vem acontecendo a alguns meses, mas felizmente ele ressuscita após a operação acima.
Se você encontrar uma solução para o problema, por favor envie um email para mim.
Grato
Aluizio

I have a KA1103 which was working perfectly until one night I turned it on and there was no audio. Period! All bands and volume levels and so forth. Should I send it back to Universal Radio? I don't know how to repair it myself.

Hi all - Mayhe the reviewed 1103 was a dud, but maybe, unlike the other manufacyurers who gave the reviewer the radio for keeps, Degen only lent the unit - this would give rise to a poor review!
Bob.

Subject: [de1103] Re: WRTH2011 and DE1103

Two years ago me and a friend of mine we bought the same drill made in China. My drill went up in smoke (electric motor)) after only 4 minutes of use. The other one is still working perfectly.
I think some Degen 1103 can sometimes be faulty.
The problem is if the defective Degen-1103 goes in the hands of who does the review.
Season's greetings
Ed

That is the thing 2 out of 5 is insane.

Second as you say there are so many pos reviews and good word of mouth. I say WRTH who?

Passport reviewed the DE1103/KA1103 in 2006 (only copy of Passport I have). They grouped receivers in categories. They had pocket portables, portables, laptop portables. In the portables, they gave the DE1103 only 2-7/8 stars out of five. That sounds low but you have to read all the reviews and ratings. (The note the performance was 3)

First radio reviews that are totally subjective, they are like MOVIE REVIEWS, they can be way wrong.

Passport called it "HOSTILE ERGONOMICS" in 2006. HA HA! Passport gave the DE1102 three stars and the DE1101 the same rating as the DE1103, 2-7/8th stars out of 5. You have to read the text. They say of ergonomics, lack of dedicated vol control, one row keypad, no BFO detent, slight SSB distortion, no tone control... They go on to say THREE STARS IN PERFORMANCE. They say if you can stand the "dreadful ergonomics" the DE1103 is an excellent performance value. I can't argue but I think they weigh the Ergo too high and don't really appreciate performance as much as they should. They really hate the display of the pseudo analog screen. Passport likes world map/clocks based on there love of three Sony models (ICF-SW100E/S) and an expensive Sony ICF-SW07 ($400). They see the LCD display on the 1103 as wasted. I like it.

I like the ergonomics and it is a plus to me, because it is compact and LIKE the pseudo analog full band display. I love the small travel size. On performance it's outstanding, from handling strong signals and external antennas with out overload to amazing sensitivity as well as selectivity. In the Pros they say it is a better receiver than the DE1102.

Ergonomics is a heavily weighted in these reviews. No doubt if the reviewer has to read the manual that is three strikes. It is not a full sized lunch box sized radio w/ lots of dials, switches and knobs. You have to get use to the JOGGLE WHEEL. I admit the VOL is a pain. For the most part I leave it parked on "16". However to set it you have a THREE STEP PROCESS:

1-Push Vol button (tiny)
2-Set Vol

3-Wait for it to flip back to TUNE

The last part, waiting for the "Joggle", a minor annoyance. I get around that by using the external speaker jack and small amplifier with vol control and headphones. I might put a sub-mini switch to just turn the speaker off, because that is what I typically want to do, just mute it. Of course just plugging in a 1/8" headphone will silence it as well, but sometimes I don't use a headset. May be I can make a small plastic plug that sets in the headphone jack to use as a speaker switch.

Also I don't use the alarms, but I find if I do, I have to break the manual out to remember how to set and cancel. No big deal the manual is pretty good. If I used that feature all the time I'd remember. The memory numbering system is odd at first but it works well. Lots of memory.

PASSPORT rated the Sony ICF-SW7600GR 3-1/8 stars ($160), which they made PASSPORT Choice with the DE1102 (3 stars) of the small portables. The other passport choice was the Sony ICF-SW07 (3-1/4 stars), a table top night stand like radio with flip screen ($400). The out of production very expensive Sony ICF-SW55 was given 2-7/8 stars, same as D egen DE1103. So in context of the rating the DE1103 did well.

Some other smaller portable radios w/ 2-7/8 stars to 3 stars:

Sangean PT-80/Grundig Yacht Boy 80, 2-7/8 star, $160
Eton G4000A/Grundig G4000A/Yacht Boy 400PE, 3 star, $160
Sony ICF-SW100E and ICF-SW100S, 3 star, $160
Sangean ATS 909, 2-7/8 star, $260

They reviewed a ton of portables in this issue and gave out lots of 1's and 2's.

The also reviewed big portables they called LAPTOP portables, like the Eaton E1 (which advertised in this issue) and Sony ICF-SW77. These radios cost $500 and got the highest ratings, 4-3/8 stars and 3-3/4 stars respectively.

We all know the 1103 rocks in what I care about RF performance.

Cheers, Merry Christmas

Topic: 2724 Message: 2729

Hi all - Firstly, I'm sorry, but English is all I can handle - sometimes not the best at that - in regard to your problem - naturally, if you're not up to working on the radio, and it's still under warranty - back to the seller. Alternatively, if you're up to opening the radio - before proceeding any further - it might be a help to download the circuit from "FILES" - if the pin 9 of IC2 (TA2057N) is either pulled up to +6v by 100K, or pulled down to 0V by 100K (I forget which) the IC2 will no longer mute. This can be handy for listening to what's happening while you are scanning as well. In your case, it should stop the radio from muting when the PLL is becoming slightly unstable (I Guess).
Regards, and compliments of the season (if this is your season - if not, no offense meant),
Bob Yorston, VK2CAN.

Hi TomW26@...

I have a Degen1103 which is showing the same problem as yours.
 Just noise on the laudspeaker but no signal tuning in all bands, including FM.
I try to resolve the problem by pressing the reset button but not working.
What I have done is remove the batteries for several hours, and replace and it works normally for several days and "died" again.
This has happened to several months, but fortunately he resurrects after the above operation.
If you find a solution to the problem, please send an email to me.
Grateful
Aluizio
aluiziosantos@...

Now repeat all the above now in my language, portuguese.

Oi TomW26@...
Eu tenho um Degen1103 que está apresentando o mesmo problema que o seu.
 Apenas ruído no auto-falante mas nenhum sinal de sintonia em todas as faixas, inclusive FM.
Eu tento resolver o problema apertando o botão de "reset" mas não funciona.
O que tenho feito é retirar as pilhas durante várias horas, e ao recoloca-lá ele funciona normalmente durante vários dias e "morre" de novo.
Isso já vem acontecendo a alguns meses, mas felizmente ele ressuscita após a operação acima.
Se você encontrar uma solução para o problema, por favor envie um email para mim.

Grato
Aluizio

As there ais no facility for editing, here are some comments to aluizioasantos

try warming up the radio to prevent moisture attack. Perhaps this might help.
Later may be you need to take some help to replace a set of electrolytic capacitors to recover the radio back to working order. all the best

Merry Christmas.

Santa says there is a VOLUME-TUNING shortcut:

1-Push Vol button (tiny)
2-Set Vol
NO -->> 3-Wait for it to flip back to TUNE <<--- NO
new #3) depress any single number on the keypad & immediately begin tuning, where you previously left off.

From: spindlecat1
Topic: 2733 Message: 2733

Thanks to everyone, and Happy Holidays. No, my radio is dead to headphones too (this my preferred way of listening, by the way). I'll try taking the batteries out for several hours just for fun. But I'll bet I have a capacitor problem. I know it's fixable.

2734. Continuous tuning on DE-1103

Yahoo group: de1103
Date: 2010-12-26 22:22:17 UTC
From: Earl H
Topic: 2734 Message: 2734

I have searched the history in this group and am unable to find the answer to the following question. When I get to the edge of the band I am on, I would like the manual tuning dial to keep going instead of wrapping around to the opposite edge of the current band. Is this possible with the DE-1103? Let me give you a concrete example: as I'm turning the dial and going up the 31m band, when I hit 10000 kHz I would like the radio to keep going 10001 kHz, 10002 kHz, etc. Currently my radio flips from 10000 kHz to 9001 kHz if I keep tuning "up". I am mobility impaired, and I can turn the tuning wheel and that's about it (can't press any buttons), so being able to do the above would help me scan more than just one single meter band. Thanks!

Earl
Sorry but the only way that I have found is to enter the frequency that would continue on up is to enter just above where the band starts over using the numeric buttons and then pressing the +band button. Possibly someone has found another way.
Lynn

From: Greg
Topic: 2734 Message: 2736

I understand what you are saying, but there is no 100Khz to 30Mhz continuous tuning with joggle dial or scan. It is broken down into bands, MW and:

MW 0.520 - 1.710 Mhz
90m 3.160 - 3.455 MHz
75m 3.860 - 4.055 MHz
60m 4.710 - 5.105 MHz
49m 5.910 - 6.255 MHz
41m 7.010 - 7.405 MHz
31m 9.170 - 9.995 MHz
25m 11.510 - 12.155 MHz
22m 13.510 - 13.905 MHz
19m 15.010 - 15.705 MHz
16m 17.260 - 18.105 MHz
13m 21.410 - 21.955 MHz
11m 25.610 - 26.100 MHz

If you want to get another frequency below MW or above 11m or anything in between you have to punch it in manually. Once in that in between area you can tune with the joggle dial, but when you get to a fixed "band" tuning up or down, it will latch into that band. When using scan up or down it is like manual tuning, it will latch into a band and scan just that band, repeating. I have got use to it and like it. Usually I am entering a Freq I am specifically tuning.

For grins I did a quick spreed sheet of Freqs not in the fixed bands or "gap band": Low, High, Range (Mhz):

00.10 00.52 0.42
01.71 03.16 1.45
03.46 03.86 0.40
04.06 04.71 0.65
05.11 05.91 0.80
06.26 07.01 0.75
07.41 09.17 1.76
10.00 11.51 1.51
12.16 13.51 1.35
13.91 15.01 1.10
15.71 17.26 1.55
18.11 21.41 3.30
21.96 25.61 3.65
26.10 30.00 3.90

Normally I direct tune. If I am scanning SW it tends to
be in the fixed bands... If you want to surf the whole
band the DE/KA1103 configuration is not set up for that.

Cheers

PS there is an exception, if you tune 1711 Khz and scan
down into the "MW" band, it will not latch onto that band,
and will scan below 520 Khz and keep going below 100 Khz
(thus the trick or hack to get below 100 Khz and connect
the MW to the antenna jack, not the internal ferrite loop
-stick antenna.

When I get to the edge of the band I am on, I would like the manual tuning dial to keep going instead of wrapping around to the opposite edge of the current band. Is this possible with the DE-1103? Let me give you a concrete example: as I'm turning the dial and going up the 31m band, when I hit 10000 kHz I would like the radio to keep going 10001 kHz, 10002 kHz, etc. Currently my radio flips from 10000 kHz to 9001 kHz if I keep tuning "up". I am mobility impaired, and I can turn the tuning wheel and that's about it (can't press any buttons), so being able to do the above would help me scan more than just one single meter band. Thanks!

2737. Re: WRTH2011 and DE1103

Yahoo group: de1103
Date: 2010-12-28 08:46:08 UTC
From: Bruno
Topic: 2700 Message: 2737

Regarding the DE1103 rating by WRTH, I just would like to remember that WRTH2010 rated the ICOM IC-7600, a $4000 transceiver with 4 stars, and the ETON Satellit 750, a $300 receiver with only 3 stars (even there are many advertising on WRTH about this receiver).
Considering this, I accept that the DE1103 (one of my favourite radios that I use almost dayly) has less than 3 stars.
As soon as I read the review I will post my full opinion about it.
Best regards
Bruno.

From: Earl H
Topic: 2738 Message: 2738

Christmas present to myself!

I just ordered a Wellbrook ALA-1530S+, which I will use for the time being with my Degen DE-1103. I know, it seems crazy to invest so much antenna into a relatively modest, though well-performing, radio. The reason is that the Wellbrook is, I hope, an investment for a lifetime whereas my 1103 will probably be replaced in the future with beefier, probably tabletop, receivers.

The other reason to go for the Wellbrook is that I live in a crowded urban area rich in QRN and have very little land (165' x 40'). And I like to DX weak signal AM and shortwave.

Now, onto my questions. Does anyone in this group use their 1103 with a Wellbrook? Was there anything in particular you had to do to get them to work together? Did you have to buy or solder together an adapter for the coax lead in from the antenna? Bear in mind, I am a DXer, not terribly handy with a soldering iron, and a bit rusty on my electronics theory. Any information any of you could offer would be most appreciated!

Sincerely,

Earl Higgins

Hi Earl,

You did a superb investment indeed and you won't regret it.

This antenna is very very fine. I have one and although it is more designed to work with tabletop receivers, I must say it works however marvelous with the small DE1103. You'll just have sometimes to use the attenuator (LO/DX) to avoid overloading.

The DEGEN1103 doesn't have any BNC socket, the antenna socket is designed for a 3.5mm jack. So you'll have to modify the connection from the interface unit to the rx.

The best would be to make a sort of "adapter", i.e. a female BNC socket + a piece of wire + the 3.5mm jack. Not difficult to solder, if you can't, ask a friend or a technician !

Good luck and let's know abt you impressions.

All the best

Dominique

From: jallenhartford2000
Topic: 2738 Message: 2740

Earl,

I have an adapter assortment, mostly purchased as is, that lets me hook up any antenna to any radio, but I have put a few together myself. Electrically my ALA 330S works well with most radios I've tried it with. My older DE-1103 lets it work on AM and SW while my newer one lets the Ant jack work only on SW. Funny that I've also got an E5 whose jack works for AM and a G5 that doesn't. Degen and Eton seem to be all over the place on that feature.

A good antenna is a good antenna. Keep in mind you will needs lots of parts go install it: rotor, coaxial, connectors, poll. I have not seen many used Wellbrooks for sale, but they tend to go for near new price. So it's a good investment.

> "The other reason to go for the Wellbrook is that I live in
> a crowded urban area rich in QRN and have very little land
> (165' x 40'). And I like to DX weak signal AM and shortwave."

Well you may find that the ALA-1530 is not the ideal antenna for your situation. That model is wide band and strong MW AM stations will cause you grief. That is why he made the ALA-330. You will find out if it is an issue or not.

> "Was there anything in particular you had to do to get them
> to work together?"

No secret... the DE1103 has a 1/8" phono plug. You will be feeding it with RG-58 coaxial. So you obviously will need to transition. The BNC connector is a typical coaxial connector. So you will need a BNC to PHONO converter. I RECOMMEND YOU DO NOT HANG COAXIAL OFF YOUR LITTLE RADIO... That jack is NOT a heavy duty chassis mount fitting. Coaxial is stiff and heavy. Cantilevering that coaxial off that little plug could damage it. So you're going to have to figure your cable connections out. I would use a high quality 1/8" audio cable. Plug that into a 1/8" to Phono to RCA jack (common). Then there is a common BNC to RCA adapter you can put use to convert the BNC at the end of you coaxial to phono. There is a 100 ways to do it. The less adaptors the better. I would make a special flexible shielded patch cable with 1/8" phono on one end and a BNC female at the other.

http://www.hifastonline.com/Camera/HF_BNC_RCA_FM.jpg

You know the DE1103 does not connect the antenna jack to MW ever! It uses the internal antenna only! However there is a work around. See the files section or archive for the gouge on how to work around that, to connect MW to the antenna jack if you don't know. It is done with button pushing hack, takes 10 secs; it keeps the internal ferrite loop-stick disabled, so you feed the MW band with the antenna jack.

2743. Re: [de1103] Re: just ordered my dream antenna

Yahoo group: de1103
Date: 2010-12-29 19:20:11 UTC
From: Bob Yorston
Topic: 2738 Message: 2743

Hi - If you keep a 1103 in its "below 100KHz" mode, which is fairly easy to do, including memoties and scanning, the front end circuitry still thinks it is at 28MHz, so the antenna socket is still active from 0 to 30MHz.
Regards,
Bob.

From: AMI
Topic: 2700 Message: 2744

All right, wise people!

3 stars is a very positive mark for any portable receiver!

5 stars belong to the most capable communications receivers, which cost thousands of dollars.

I hope, that you are wise enough to understand this simple fact?

If not, that is not my fault, perhaps it is yours?

If these certain portables, made in China were really manufactured to contain all possible characteristics, as the best communications receivers, you could not be able to talk, as you now have done,right? At least they would be worth more, than most of us were willing, or capable of, to pay for them!

There is no way to compare my Ten-Tec RX340 DSP RECEIVER with my DEGEN DE 1103 Portable. They are really, really from two (2) different worlds! Would it be possible to have both 5 points (*:s)?
I would be a fool to do that!

As a portable, as it is, as a cheap portable, as it is, DE1103 is a very good receiver!

But no more than that. But to be as good as a top Communications receiver, what do you think, my good friends? NO, NO ,NO!!!!!!! NEVER!

Those people at the WRTH, who are giving points, are rather well capable of doing their job, are they not? They are not able to give the same points to all possible receivers, because their characteristics are so different! DOT!

Best Regards from AMI, a veteran DXer, 73.

Are these the instructions you are referring to:
http://ukradio.info/Degen/VLF.txt

Are these supposed to work on all variations of the 1103? I bought mine last year. I will give them a try shortly.

I hope the Wellbrook doesn't end up overloading my 1103. I live about 2 miles from a 5000w non-directional daytimer on 850 kHz (KFUO). Two 50,000w stations are within 10 miles (KXEN-1010 and KMOX-1120). As far as urban environments go, I think I am about average in terms of strong locals. All of my locals above 1200 (1260, 1320, 1380, 1430, 1460, 1600) can be nulled enough to hear other things when conditions are right. My biggest problem is electrical noise, both from my own house and the neighbors and just the neighborhood in general. My thinking was, the Wellbrook gets much praise for reducing local electrical field noise.

Sincerely,

Earl Higgins

Hi AMI,
WRTH2011 rated the Cheap Tecsun PL-310 with ... 5STARS!!!!
Also rated the also Cheap Tecsun PL-380 with ... 5STARS!!!!
... but the DEGEN DE1103 with...2 STARS!!!

My father received the WRTH2011 yesterday and I couldn't believe what he was telling me. I have to read the article with my eyes, and then I will write to WRTH anking for detais about their test procedures.
It looks like that something is wrong not only with the DE1103 rating, but with the Tecsuns 5 stars.

2747. Re: just ordered my dream antenna

Yahoo group: de1103
Date: 2010-12-30 15:42:15 UTC
From: Greg
Topic: 2738 Message: 2747

You have several issues.

I was the one who mentioned strong AM stations with the 1530 model. You will find out if it is a problem. There is no work around. The antenna is broad band tuned from LF to SW. You can't put an attenuator on it for this. Again the 330 is sold for strong AM BCB locations. People use the 1530 and it is fine, but put up with some issues popping up in the SW band from local strong AM stations. You will find out if the strong MW station is a problem. This is not a radio issue, it's a Wellbrook broad band antenna deal.

Second issue, over driving the radio. Again you will find out, but the 1103 is pretty good and can take a lot of signal. If it is an issue, you can turn the gain down.

Third electrical noise, mount the LOOP away from your house and neighbors by at least 5 meters in the garden. Don't mount it on your roof. The typical mount is on a poll, does not need to be high up. This typically means you will need to bury the FEED LINE and rotor control wires under ground. They can be co-located with out issue. You should join the Wellbrook Antenna groups... there are two of them.

Cheers.

2749. Re: WRTH2011 and DE1103

Yahoo group: de1103
Date: 2010-12-30 18:47:08 UTC
From: Mvs
Topic: 2700 Message: 2749

While I understand the anxiety of many members, who are owners of the radio,
I would like to view any criticism , due, overdue, undue, with due care, as it helps the company improve the product.
I see many troubles faced by many members perhaps the moderator could list out over a period an d comment whether the firm has been trying to address and improve upon. . later serial numbers, old problems should not t repeat,is an indication.
Why we should feel bad if the org, or Mag has left scope for improvement. we know of sets just purchased and go faulty for no reason.
On the other hand a flattering report would boost up temporarily and leaves scope for prestige and not for improvement.
My father used to tell, reaching a top rank, might be easy, but difficult to equidistantly sustain that ranking.

I sincerely hope i have not hurt any member here, as it was not m intention\, neither the Industry.....

From: Dominique Kremp
Topic: 2738 Message: 2750

Hi Earl,

I sent following post yesterday Dec. 29th at 1225 but it happens it never came to the group.

Thant's why I send it a second time with the hope it works.

All the best

Dominique

Hi Earl,

You did a superb investment indeed and you won't regret it.

This antenna is very very fine. I have one and although it is more designed to work with tabletop receivers, I must say it works however marvelous with the small DE1103. You'll just have sometimes to use the attenuator (LO/DX) to avoid overloading.

The DEGEN1103 doesn't have any BNC socket, the antenna socket is designed for a 3.5mm jack. So you'll have to modify the connection from the interface unit to the rx.

The best would be to make a sort of "adapter", i.e. a female BNC socket + a piece of wire + the 3.5mm jack. Not difficult to solder, if you can't, ask a friend or a technician !

Good luck and let's know abt you impressions.

All the best

Dominique

Objet : [de1103] just ordered my dream antenna

Christmas present to myself!

I just ordered a Wellbrook ALA-1530S+, which I will use for the time being with my Degen DE-1103. I know, it seems crazy to invest so much antenna into a relatively modest, though well-performing, radio. The reason is that the Wellbrook is, I hope, an investment for a lifetime whereas my 1103 will probably be replaced in the future with beefier, probably tabletop,

receivers.

The other reason to go for the Wellbrook is that I live in a crowded urban area rich in QRN and have very little land (165' x 40'). And I like to DX weak signal AM and shortwave.

Now, onto my questions. Does anyone in this group use their 1103 with a Wellbrook? Was there anything in particular you had to do to get them to work together? Did you have to buy or solder together an adapter for the coax lead in from the antenna? Bear in mind, I am a DXer, not terribly handy with a soldering iron, and a bit rusty on my electronics theory. Any information any of you could offer would be most appreciated!

Sincerely,

Earl Higgins

Actually, Dominique, I believe your post did show up (eventually). I appreciate the input from you Dominique, and everyone else, especially Greg who encouraged me to join the Wellbrook Yahoo newsgroups. I followed his advice and was welcomed with a wealth of information. I decided to e-mail Andy at Wellbrook and ask him his advice regarding use of this antenna with an 1103 with strong mediumwave signals nearby.

Imagine my surprise that he responded within 30 minutes! Even during this holiday week for many people. He suggested I amend my order to the ALA-1530L which is slightly less sensitive at mediumwave/longwave frequencies and is probably a better choice for me. With my permission, he refunded the difference and changed my order to the "correct" antenna (1530L) within minutes.

I'm very happy with Wellbrook Customer Service. I hope this didn't stray too far from being on topic for the DE-1103 newsgroup (after all, I am specifically discussing using this antenna with the 1103).

Happy New Year everyone,

Earl Higgins

From: Dominique Kremp
Topic: 2738 Message: 2752

Hi Earl,

Glad to see that my 2nd sending was successful !

I'm not surprised about Andy's prompt super reaction. This guy is very helpful and he always replies within maximum 3 hours.

In the Wild West one would have say of him that "he shoots faster than his own shadow" !!!

I can only recommend this company and its friendly customer service !

His advise concerning the less sensitive ALA1530 version is very wise. I own an ALA1530-L too, it has abt 2 or 3dB less gain in the LW and MW ranges than the "normal" ALA1530 indeed. But from 6MHz up both antennas have the same gain.

Another tip: install it on a rotator if you can. There are small and unexpensive ones for 25$. It's very useful with these antennas to null-out signals under 2,5Mhz !

Don't forget to let us know about your impressions.

Happy New Year to you and to everybody all over the world !

2753. Tuning knob

Yahoo group: de1103
Date: 2011-01-02 16:28:53 UTC
From: shane
Topic: 2753 Message: 2753

Happy new year to all.
I am considering purchase of a small portable such as the 1103 because it has a tuning knob. I have a Sony ICF-7600gR which is a fine radio but it has no tuning knob. This is a hassle when attempting nightime (in the dark) tuning of AM and MW DX stations.

My question is how is the tuning knob on the 1103? Is it smooth and easy to use (such as in the dark or by a blind individual)? If not can anyone recommend another portable with a nice side tuning knob? Preferably something in current production.

Hi Shane

You will find no problems with the tuning knob, but anyone with a vision impairment may experience problems altering the volume because the tuning knob doubles as the volume control. You have to press and hold down the volume button, then wait for the 'Vol' display to flash before changing the volume.

The AGC is very effective. I hardly ever change the volume setting on mine.

Although many of you are unhappy about the two star "fair" rating of the DE 1103, t he biggest issue Degen/Eton has is of QUALITY CONTROL, or the lack of it more specifically.

If you look over the various postings on various websites and forums you will notice that the uniformity of the model is not very good, and the Eton versions are really pretty poor, with many defects to be found. I would suggest you head over to the Grundig G3 (a Degen produced product using an almost identical guts to that of the DE 1103 and I would say that 70% of the units are defective or substandard in some way shape or form...

I have an Eton E5 and sure enough it came to me brand new with a defective frequency readout straight out of the box. I was able to fix it myself, luckily.

I think that WRTH was including the aspect of overall QC and uniformity in the model and unfortunately it just isn't very good.

In the past WRTH has always been very nonpartisan and fair with its reviews, and yes they are somewhat brutal and demanding reviewers to be sure but after all isn't that what we want?

From: DB
Topic: 2700 Message: 2757

You have pretty well summed up my thoughts on the topic.

My DE1103 is an excellent low priced radio except that about 1/3 the time it generates a buzz that makes weak signal reception impossible. I can eventually make the buzz go away by tapping the back of the radio. It goes away until I bump or sometimes just move the radio. I expect that I will be able to find the problem and fix it when I get around to opening the radio and probing it's guts.

The batteries were unusable as received too. One of them wouldn't take a proper charge so battery life was under an hour. Batteries are easily replaced, but bad batteries don't rate a 5 star rating either.

If I can fix the noise it will be a bargain for the price but it's not my girlfriend so I'm not going to get my nose out of joint if a reviewer points out that it's not perfect.

If the reviewer had reviewed my DE1103, I don't think it would have deserved 2 stars.

you recommend the Grundig G3? Have stock in the company?
Ha ha.

The G3 was rated at 3.4.
The DE1103 was rated at 4.6 (4.5 for kaito 1103 version)

Reading the reviews at eHam it has as much hit and miss
as any radio. Further direct comparison to the 1103 and
other radios left people disappointed.

http://www.eham.net/reviews/detail/8447

I think the massive amount of 1103's out there there are
more hits than misses. Mine is rock solid for 4 yrs now
with fairly regular use.

You have a defective radio. My 4 yr old 1103 has zero buzz.
It is the lowest noise radio I have. If you have to whack
it on the back to make a buzz go away, that's not normal.
I have never heard this complaint by any one before.

My batteries were 100% and still are the best NiMh I have
used in it. They are still going strong after 4 yrs. They
hold a charge and give me over +10 hours of operation. They
are Degan brand 1300 mA hr rated (but last longer than new
2000 mA hour NiMh I have).

Your experience and opinion is the exception not the rule.
My experience and opinion is 180 degrees opposite. Sorry
you had so much problem. My KA1103 is awesome. May be you
should buy Kaito KA1103 next time.

Cheers

Shane,

I have very limited mobility in my hands and I find the tuning knob on my (Degen) 1103 to be extremely easy and smooth to operate. I've had it for a year and can highly recommend this radio! The Tecsun PL-310 is another great little radio with a tuning knob you might consider, although the SW section on it isn't as good. They are so cheap on ebay, get both!

I don't believe there are any DAB capable versions of the 1103. Your only decisions are: color, and Degen or Kaito. Do you have a link to the Ebay auction that purports to have a DAB version of the 1103?

Sincerely,

Earl Higgins

Hi Cesare,
I never heard of a DE1103 with DAB. Some sellers may classify it in a
particular category such as DAB/Digital Radio, others may offer you a
discount package (with, for instance, an active antenna) at a different price.

Could you please post a link to that DAB-capable DE1103?

Regards,
Moises

The seller picked a default template of description from ebay, he haven't wrote or prepared his own, and those keywords he just clicked for digital radio, which came with the word DAB, I think the seller doesn't have much Idea about the radio receiver itself.

Don't worry its not DAB enabled...

Yahoo group: de1103
Date: 2011-01-08 16:33:04 UTC
From: shane
Topic: 2753 Message: 2769

Well earl, I took your very good advise and got a KA1103. Played with it last night listening to "flying saucer radio" on AM. Logged all kinds of AM stations coast to coast broadcasting the same program.

The best thing about this radio is the tuning knob. It's funny...my Sony 7600GR has no tuning knob but a volume control that I set and seldom use. The KAITO has a TUNING knob which I use constantly and the volume adjustment that you set and forget. Side by side radio tests indicate no difference in receive so I gave up nothing and gained everything. I'm afraid the Sony has to ride in the back seat now.\73,
Shane

My radio is not so good in FM band, I´ve compared it with my mini system Aiwa and the car receiver Pioneer, the car with its telescopic antenna and the system with a piece of wire that come with it. Both receivers seem to have equal or better sensitivity in some frequencies than my 1103. I´ve just bought it because the FM band and I´ve seen in foruns, reviews and youtube that DE1103 is an amazing FM receiver, but my radio's quality is the same as a radio that costed me 5x less.
Has someone the same problem with FM sensitivity?
Thanks for any help.

Hi

Have you made sure the DX/Local switch is set to DX? This would cause a sensitivity drop off if it is set to local.

I haven't had a problem with low sensitivity, mine has been quite the opposite, in an environment where there are 14 local FM stations, the overloading is so bad that the FM band is useless except for listening to local stations.

I read similar comments in reviews saying that the FM performance was very good, I came to the conclusion that any receiver review is only as good as how the reviewer found the receiver. For example, if the reviewer had few local or near local FM stations, chances are the FM results would be favourable. If the reviewer lived in a busy metropolitan area where there were many stations, the findings from the review may have been different.

Moral of story is, use reviews as a guide not as gospel.

As an aside, I also have a Digitech AR 1747 known to the rest of the world and a RedSun RP2100, using the telescopic whip, FM performance is fair. Again, overloading is a problem though not as bad as with the 1103. I tried connecting an outdoor three element Yagi to see what would happen, the results were quite amazing, the overload went and it has turned out to be a very good FM DX receiver. Sadly, no such improvement occurred with my 1103.

Yes, I´ve done it, although the switch seems not to affect the FM band in my radio, it gets the same signal in DX or Local. And the switch is good because in the other bands it works perfectly. Thanks.

2776. Re: Antenna SONY AN-LP1

Yahoo group: de1103
Date: 2011-01-16 17:04:05 UTC
From: Greg
Topic: 2771 Message: 2776

It should work fine. I don't have a Sony AN-LP1 but the radio of course has a 1/8" phono jack for antenna input. I recall reading review of a AN-LP1, ending with a 1/8" phono.

You can use either the clip on the antenna or antenna jack. The antenna jack is better.

No worry of blowing anything out. I use a similar amplified loop, the TG34 (same as DE31MS, KA33...)

Performance will be specacular. In fact here is a review of your antenna and one like mine.

http://www.radiointel.com/review-degende31.htm

NOTE:
The 1103 MW works with the internal LOOP STICK, not antenna jack. You can trick the 1103 to disconnect the loop stick and connect MW band to the antenna jack. The method is in the files. It is easy, you just tune to 1711 Khz manually. Then scan down into the MW band. If you select another band, or tune outside the MW it will disconnect the antenna from MW when you return to it manually, just going back to how it normally works.

Cheers

My experience with car radios is that provided it is a quality product (not a cheap brand from a discount store) performance on FM and AM for that matter, has been extremely good.

I have driven around town listening to Australian FM stations via skip and years ago, when KUAM 870 was on the air from Honolulu, Hawaii they put in a good signal while I was mobile around the city.

As far as the type of car radio used, it is definitely a case of you get what you pay for.

I've forgotten to write the conditions of my town for receiving FM signals. I live in a small town surrounded by mountains, there's just one FM station in the town and 3 strong stations in the near cities, I haven't problem with signal saturation, and my system Aiwa is far from good for receiving FM signals without an apropriated antenna. Because of that I think my DE1103 has some problem in FM receiving, since the weak stations are sintonized in the same level as my system Aiwa.

Here is a link to a review of Sony's AN-LP1. You will see it derives power from certain Sony radios (and not recommended for some others). The Degen 1103 delivers no such power via the Ant socket.

http://www.universal-radio.com/catalog/sw_ant/3676.html

2781. Interval signals

Yahoo group: de1103
Date: 2011-01-18 05:58:19 UTC
From: poikaa
Topic: 2781 Message: 2781

s you are tuning around the shortwave bands and the time is just before the hour, you may hear short sections of music, maybe birds singing or even tones....
These are interval signals and they have been in use for over 80 years. As a station "signs on", it is normal for the station to broadcast these intervals to inform listeners that the radio station is to begin a transmission of programing on the next hour.
Interval signals are usually commence about three to five minutes before the hour and are played at the end of broadcasts. Main purpose is to identify the station, let others know the frequency is in use and is used a a tuning aid.
These can be lots of fun as they have a very identifiable, typical and unique sound to each country. Most of the time it is music, usually a snippet of the countries' national anthem or an identifying song. For example Radio Australia has a very recognizable tune "Waltzing Matilda" along with different target languages. On rare occasions you may "catch" the kookaburra bird song!
Here is a link to hear samples of these interval signals listed by country ....

Thanks to Greg, Jallenhartford2000 and to Scamozzi2003 for their replies and for the links they passed.
The antenna works very fine indeed with the DE1103.
See you

Dominique

2783. Re: Antenna SONY AN-LP1

Yahoo group: de1103
Date: 2011-01-18 12:30:04 UTC
From: jallenhartford2000
Topic: 2771 Message: 2783

I wish Universal would update this 10 year-old description because it is incorrect. The ANLP-1 DOES NOT "Derive power" from ANY radio. Rather, it receives a small SIGNAL voltage to tell it to turn on or off when conencted to the mentioned radios. But this signal voltage is for triggering only...the power to actually operate the antenna is supplied by its own batteries and it will not work without them. This is also why it will work with any radio.

Also, it works very well with the SW77 even though Sony themselves originally said it didn't.

Jay

2785. Analogue Tuning Pointer.

Yahoo group: de1103
Date: 2011-01-18 23:30:21 UTC
From: radioshedtw
Topic: 2785 Message: 2785

Hi Group.
When I do the trick to get the '1103 to use the whip antenna on MW, ie. select 1711khz and then scan down, the horizontal tuning pointer on the analogue scale disappears. even when the set is tuned well within the MW band as indicated by the digital frequency display. At all other times the pointer works on all bands, including MW, exactly as expected. Apart from this the set works perfectly. Has anyone else noticed this ?

Thanks, Ian.
London UK.

Betreff: [de1103] Re: Odd frequencies silent, even frequencies normal

Excellent thread!

Gives an idea that these radios are passed rather quickly through the assembly line and a simple "goof" can be missed! Eton may have the same problems...

Hi,

I have order the new "DE1103 RADIO FOLDING BACK STAND" from ebay (http://cgi.ebay.com.sg/FOLDING-BACK-STAND-DE1103-DIGITAL-PLL-DEGEN-RADIO-/130395341562) for replacement.

The problem is I don't know how to install them correctly. did any one have chance to replace the new "DE1103 RADIO FOLDING BACK STAND"?

Thanks

From: umassys
Topic: 2799 Message: 2799

greetings from the uk [:)]

i'm on the verge on buying a 1103 from ebay. my only concern is the power supply provided in the package. the seller lists in their advert that the radio requires power from an adapter dc as '8v 300ma' . is this correct? can a uk user check to see if their 1103 says 8v or 6v on the side?

if it is indeed 8v, then my question to users here in the uk. what power adapter do you use to recharge the batteries? any supply i purchase will only be used to recharge the batts so i am not bothered about power adapters that introduce noise [:)]

i have seen on here a user who has said that their unit arrived with the 2 pin usa adapter and they simply used a uk shaver plug. is this safe and possible?

many thanks
stuart

2800. Re: [de1103] new user from the uk looking for help...from Belgium!

From: bruno geuth
Topic: 2799 Message: 2800

Stuart,

I live in Belgium and my DE1103 came from China via eBay, seller SUNSLF.

It indicates on the radio and on the supplied adaptor 8V, 300Ma. I use this adaptor to charge the supplied batteries.

Changing to a UK plug is no big deal, as long as you have 220V. Why don't you order a set with supplied power adaptor?

Thanks,
Bruno

HI

Best idea is to use an external charger, mine was an American version bought from Amazon as the KA1103. I've found the batteries last ages between charges. The variable of course is how long you use the radio in each session.

I've forgotten what mine came with, but it created a lot of noise when
powering the radio and charging the batteries took a long time. I use a
separate charger for the batteries, it's a lot faster.

thanks for the replies so far.

ideally i am looking to keep the batteries in the unit all the time, rather than do as leon describes. so any power adapter help (specific to the uk market) is still very welcome!

You can use the same adapter used for Eton G5/E5 or G3. It is available in UK from http://www.moonraker.eu/Eton-Radio-Accessories

thanks for the info [:)]

well after searching the www last night, i'm a little more confused! the info in this pdf (on power supply page) actually shows the voltage as '6v' on the side of the radio!

http://www.radioamateur.eu/schemi/rx/DEGEN_DE1103_user.pdf

maybe some units ship with '6v' and some with '8v'. who knows! i'll see what is what when the unit actually arrives.

Hi. My G5 and Ka1103 both say 6v on the radio, but both came with identical 8v wall wort power supplies. Early units came with a power supply with a more rounded look, which caused noise in the radio. I have the newer more squar looking supplies that do not cause noise in the radio. Both of my radios charge the batteries (Kodak 2100Mah pre-charged NiMH) flawlessly. Both radios will run 24-28 hours on a charged set of batteries. Your mileage may vary.

The real request for the DE1103 radio is +8V/DC with center positive, this is confirmed.

For the confusion on the external power adapter, the most simple way is see it is the 'print error', in fact, for the 6V marked power adapter (original coming from the manufacturer), if you test the output voltage, you will find it is +8V on meter.

i feel that the adopters concerned are just unregulated and thus might show 8V on no load.
As we plug in and draw current, the voltage might come down.
the charger circuitry inside DE1103 regulates the charge by constant current mode with voltage upper limit, perhaps.

i have one of these

http://www.wsplc.com/acatalog/SMP-1000A_Switch_Mode_Power_Adaptor.html

the reason i posted the question in the first place is as you can see from the adapter above, there is no '8v' listed. i spoke with waters & stanton and they seemed to think that setting it to '9v' would be fine. they also said '6v' may be fine!

so what do users here think of this adapter? is it suitable for my purpose?

should work, unless the internal; design has a low voltage sense, on input dc socket, and shuts down.

Hi. Yes I charge my batteries with the included 8v power adapters. It has been speculated here that the higher voltage is needed to charge the batteries.

Topic: 2789 Message: 2817

The stand on my G5 broke a while back, but I repaired it by drilling into it lengthwise with a mini drill where the pin used to be, then inserting a length of heavy steel music wire into it, and cut it short enoough to act as a replacement pin. It works great, and won't be breaking off anytime soon.

I hope my description is clear enough, given the language barrier.

Yes Radio is marked 6V, this is not a surprise as it is also powered from 4AA Cells or batteries.
On the other hand, a 6V wall wort could be not filtered and show 8,48V (6*sqrt(2)) I believe.

And finally, I must say that I would be confident in Tao Qu, he is a perfect gentleman, I've bought 4 units from him through the years, and all work perfectly. If he says that a 8V adapter will do the job, it's probably the case.

To put new one you can use tooth stick. Place him in the middle gently band over the new stand and pull stick out in the end.

I don't recommend a switching power supply -- which this undoubtedly is -- for any radio, because they generate so much hash you probably won't be able to hear a thing.

You need to find a 7-8v supply with a transformer.

Btw, I discovered when using a large 6v gel cell battery as a power source that a circuit inside the radio would switch over to the internal batteries when the voltage dropped to 6v or below, which connected both sets of batteries and drained the AA's very quickly. I would stay away from any supply under 7v.

thanks for the reply nelson. i'm not worried about noise from a switching unit as i only want to use the power adapter for one purpose - charging the batteries.

so with that in mind will this adapter be ok?

Hi Jean-Chris,

Thank you.

Hi all,

I would like to summary some information about the voltage and external power adapter used on DE1103 here for your reference.

The mark on the DE1103 radio is +6V/DC, but this is the mark only, the fact is it is +8V/DC drived.

For the 120V/AC external power adapter, the mark on it is +8V/DC.

For the 220V/AC external power adapter, the mark on it is +6V/DC.

So final summary: the DE1103 radio is drived by +8V/DC, for end user, please use the manufacturer configured external power adpater coming in the package.

2825. 6v transformer verse 8v switching wall wort...

Yahoo group: de1103
Date: 2011-02-17 14:41:14 UTC
From: aircheckclover
Topic: 2799 Message: 2825

I'm hoping to clear up a mystery here, not add more confusion, And I will say up front the mystery may be only in my mind...

It is my understanding that switching power supplies - the newer type of wall wort internal construction - should be rated a little higher than the battery demand due to the nature of the switching supply under load. Conversely, it is my understanding that the old school transformer/rectifier/filter wall wort should be rated at the battery voltage.

Is this correct?

From: poikaa
Topic: 2826 Message: 2826

I recently had the privilege of repairing a SONY ICF-7700. It need a few capacitors changed out as they were shorted and leaking, out of spec if you wish.
Since I own a Degen DE-1103 this SONY made my day as the repair came out very well! The radio it self is something else....
The 7700 resembles the DE-1103 both in size and function along with the odd combination digital display and digi-analog scale. That's where it ends, as the SONY has less than full coverage and no SSB or BFO. Internally the radio is very different.
Looking at the SONY next to the DE-1103 I am thinking the design of the 1103 came from the SONY. The 7700 was produced for a short while in the mid eighties, was popular as it is a good sounding radio.
Here is a link to a video I made for You Tube....

As far a radio power supplies are concerned, it is preferable to have linear power supplies that use a transformer and have a regulator after conversion to DC. Even though we feel that we would use it for charging alone, we also use it for direct listening.
SMPS would create harmonic noise that definitely disturbs radio reception , except perhaps on FM band.

Sorry to disagree with you.

I've used a wide variety of Sony equipment, both consumer and professional, from about 1970 onward.

I've come to the view that the consumer equipment is no longer value for money. Sony are selling on their reputation; their equipment is now expensive and overrated. This wasn't always so - I have the service handbook of an early Sony colour TV in front of me, and the circuitry is full of elegant and ingenious design features. I'm not surprised that your old CRF5090 is still working - that was the period when Sony were producing some very good consumer electronics indeed.

Sony professional equipment is still respected. It's just the consumer stuff that's become rather unremarkable and overpriced.

The fate with the famous ultralight SRF 59 is well known. Launched around 5 years ago, became the first receiver used to DX on MW transpacific stations (Gary DeBock and others started the Ultralight DXing fad with this receiver). Sony used a propietary IC for nice sensitivity, selectivity and AGC.

Later it was discovered that the variable capacitor became progresively defective, introducing scratchy tuning and ruining all reception. This problem affects other Sony mini receivers as the one my wife was at home, don't remember the model now. The reason: in contrast with the SRF 39 model Sony made it a cheaper product using a low quality variable capacitor for the production of the set.

BBC cut all SW radio targeting USA years ago. You can recieve the scraps of BBC signals from Africa, South America. I morned the loss of BBC years ago. I've moved on. Besides we kicked the Brits out over 230 yrs ago. (Ha ha)

BBC SW radio has been LONG GONE from North America, replaced with internet, cable TV and satellite radio service. I can't argue with that. Intetnet streaming audio or pod-cast is far better than SW radio for all intents and purposes. As a radio hobbyist it sucks.

In the USA you can get BBC on PBS TV (over the air). They carry BBC news and a few re-run Brit shows. On premium or digital cable TV you can get BBC America. I watch Top Gear. Great show. Other than that all the SW targeting USA was cut years ago.

It's inevitable that BBC would be divested. It's a Gov run inefficient bloated institution. UK should have got rid of their Gov run "state radio" monopoly 50 yrs ago. It is just down right un-American! :)

There is talk of not giving Federal funds to PBS and NPR in the USA to cut cost. They are mostly viewer funded by fund drives.

The worlds ECON is getting a reality check ;the fat has to be cutout. Time to get lean and mean.

Cheers.

Well, not all Sonys were born alike... it depends
where where they manufactured.

I am the proud owner of a Sony ICF-7600DS
receiver, Made in Japan, one of the first Sony
all-band portables with PLL and digital readout.
I purchased it by 1990 or so, and stills works
fine in spite of some mistreatment. On the other
hand you have Chinese Sonys such as most of the
current receivers (for instance the SRF-59
mentioned by Horacio), and the difference in quality is obvious.

Chinese industry does suck! I purchased a DE-1103
in 2007 and now is dead. The other one I
purchased in 2006 is beginning to make the same
kind of noises the first one did before
dying. "What do you expect for 50 bucks?" they
will say. And yes, that is what we have...
unfortunately is from difficult to impossible to
find a world-band portable NOT coming from China.
So we end up buying them anyhow. That is the way this industry works...

From: Nelson
Topic: 2799 Message: 2834

The original transformer wall wart is marked 6v, but puts out just under 8v without any load, which is typical of low current unregulated power supplies like these. The factory supply needs a little extra oomph for battery charging.

Some switching supplies may actually have some regulation built into them, but most transformer wall warts don't. I was lucky enough to find a very nice 1 amp, 5v regulated transformer wall wart from an electronics surplus place that I use for an old Sony multi-band radio, and it's much better than the original low current supply. No more dimming lights when I turn up the volume.

An inaccurate statement.

The BBC is mainly Government funded, NOT Government run, which is why whichever party is in power in the UK they criticise the BBC (e.g. the resignations following the Hutton Report). It also receives funds from book, DVD sales, and advertising (it is prohibited from advertising within the UK).

UK radio/TV is funded by UK license fees, but the World Service is funded by the Foreign Office, but the proposal is to transfer funding from UK license fee payers.

Located at the moment near the Middle-East, I am aware that the BBC World Service in Arabic & English is getting a LOT of listening to in the past few weeks whilst satellite & internet are being closed or heavily censored by local governments.

Regarding PBS, as the Government only provides 1% of their funding it won't make a huge difference to either the Government of the service if funding is withdrawn

Rod,

I remember that the reviews of both radios in Passport to WB Radio both seemed to suggest that wasting so much dial space with a fake simulated analog tuning dial was an incredibly poor engineering choice, Frankly, though, I think they both look pretty "cool"

Mike

Subject: [de1103] The origins of the DE1103?

I recently had the privilege of repairing a SONY ICF-7700. It need a few capacitors changed out as they were shorted and leaking, out of spec if you wish.
Since I own a Degen DE-1103 this SONY made my day as the repair came out very well! The radio it self is something else....
The 7700 resembles the DE-1103 both in size and function along with the odd combination digital display and digi-analog scale. That's where it ends, as the SONY has less than full coverage and no SSB or BFO. Internally the radio is very different.
Looking at the SONY next to the DE-1103 I am thinking the design of the 1103 came from the SONY. The 7700 was produced for a short while in the mid eighties, was popular as it is a good sounding radio.
Here is a link to a video I made for You Tube....

I was lucky enough to find a very nice 1 amp, 5v regulated transformer wall wart from an electronics surplus place that I use for an old Sony multi-band radio, and it's much better than the original low current supply. No more dimming lights when I turn up the volume.

"The principal means of funding the BBC is through the
television licence, costing £145.50 per year per household"

£3,493.8 million in licence fees collected from householders
£775.9 million from BBC Commercial Businesses;
£294.6 million from government grants;
£41.1 million from other income, such as providing content
to overseas broadcasters and concert ticket sales.

Yes of the £4,605.4 million ($7.48 BILLION USD) only 6.4%
is from the Gov, but 75.9% comes from Tax! Yes forcing
people to PAY for TV is TAX!!!!! That tax is controlled
and administered by the GOV.... Your 1% does not float.
I can only assume you work for BBC. BBC only earns 18%
of it's keep. Who are you kidding?

> The BBC is mainly Government funded, NOT Government run,
> which is why whichever party is in power in the UK they
> criticise the BBC (e.g. the resignations following the

May be monopoly would be a better term. Gov does control
the funding, and purse strings have power. They pay for
a HUGE part, with tax payer money. $240 USD a year is
paied to the BBC by each household.

Greg Dyke, the ex director general of the BBC was sacked
by Blair's government for allowing the truth to be told
regarding a dossier that had been embellished by Blair
and Alistair Campbell (known as the dodgy dossier).

Any claim to impartiality or public ownership of the BBC
is sickening and a farce.

It is not called BRITISH-BROAD-CAST for nothing. It's not
a FREE MARKET, capitalism, competitive system. The Gov
does not freely issue license for TV or Radio. At one time
they issued none. Remember Radio Carolina, the pirate radio
station in an old ship off the England coast in the 70's?
England had three channels back in the day, BBC 1, BBC 2
and Radio 3. Clearly there is not a lot of dissenting
voices or diversity.

What about the Hutton Report? It proves my point.
http://en.wikipedia.org/wiki/Hutton_Inquiry

Gov DOES exert pressure on BBC. There are lines drawn, but
lets fact it no journalism is with out bias. Yes the Gov
does not CONTROL it, by the vary nature it's VERY political,
with politically appointed flunkies in charge of it, who
can be fired by the Gov. It is also very conservative (as
in cautious, reserved) and not likely to get the full scoop.
Again the interned rendered this and other dinosaurs (news
papers) obsolete. I am just old enough to remember all the
dinosaurs and fondly remember news paper ink on my fingers,
but times change. It is hard to take a laptop with you in
the toilet.

> Located at the moment near the Middle-East, I am aware

I am not saying BBC sucks or has no purpose or use. However
the point I was making, Short Wave Radio (which I love) is
antiquated with the Internet, satellite radio, cable TV.

You can SEE what is going on live from camara phones or
from "Twitter" and other means, that circumnavigated the
old media institutions. Look I'm not "A Subject of The Queen"
and thus don't pay Brit Taxes, so if the British folks love
funding their TV and Radio fine by being TAXED. Good.However
the reality is BBC DOES NOT EARN ITS WAY. IT IS PUBLICLY AND
GOVERNMENT FUNDED TO THE TUNE OF 80%.

The money to "Foreign Service" comes from where? Revenues?
I think not. 82% of the Foreign service is from the Gov/Tax
payers. If the Brits want to fund it fine, I have no say.

I hope you don't lose your job at BBC. As I said BBC cut
out Short Wave Radio service to North Amerca many years
ago. I have no say what BBC does and to who. I can say
that it's too bad, but it's called the Economy. Bloated

institutions that basically operated on wealfair are going
to be hurt like everyone. You earn your keep or you go.

Cheers.

HOW DARE YOU. You can't debate so you do what? Call
mea liar and RIGHT WINGER? Well you are wrong on both
accounts. Read my post to Paul M <pmooney22@...>.
Seems Paul M is lying or works for BBC.

What am I lying about. I dare you do tell me how
I lied? Other wise you should hold your tongue.

If the BBC went away there would be NO lack of
information. Get you facts straight. I guarantee
you would not call me a liar to my face coward.

BTW it was the BBC that "sexed" up the pre Iraq Intel.
There was not critical journalism going on there.

Last I DON'T GIVE A @#$%. BBC can stay or go. Who cares.
BBC is not going to make ANY DIFFERENCE. Also I point
out they don't broadcast in North America via Short
Wave. They have Sat Radio and are picked up by USA's
PBS TV for the news. We have BBC... The Shortwave radio
is redundant. DO YOU GET THE POINT?

Have a nice day.

Greg,

your rant and claim that I am a liar falls down on two further inaccuracies:

1. that I suggested that 1% of the BBC funds comes from the British Government. I did not and never have made such a comment.

2. that I am employed by the BBC - I am not and have not ever been in their employ.

3. the BBC is a monopoly. The UK has numerous other radio/TV providers. I fondly recall listening to Radio Caroline (sic) and others (Radios Essex, London, etc) but do wonder (as I did with your comments about your lavatorial habits) what relevance it has - the pirate ships anchored outside British territorial waters was nearly 50 years ago.

4. The body that keeps an eye on the BBC (the BBC Trust) is not appointed by the Government. The Director-general of the BBC is selected by the BBC Trust.

4. Greg Dyke resigned (he wasn't sacked) because the Hutton Report criticised the way the BBC handled Dr Kelly's 'leaks' and subsequent death. Blair's office had complained after initial news reports about the September dossier, Dyke immediately defended the reports for accuracy without checking them out.

5. I'm afraid that I don't have your intimate knowledge of secret British Government/intelligence services documents to state with your certainty about the September dossier, but I regret that Lord Hutton didn't call you as a witless - his report said that the was no evidence that the report was 'sexed up' to bring about the war in Iraq. You would have able to correct him.

6. That the funding of the BBC is

BTW, I'd like to congratulate TV stations like BBC World and Al Jazeerah International for the superb coverage they gave of the revolt in Egypt, especially after the government cut internet access and demanded that phone operators close their service - meaning very little facebook, tweeter, SMS etc.

I also had to smile at this in your original post:

> UK should have got rid of their Gov run "state radio" monopoly
> 50 yrs ago. It is just down right un-American!

They did get rid of the 'monopoly' 50 years ago.

And as soon as the UK officially becomes the 52nd state I'm sure they'll stop being 'un-American'.

Don't forget, there's a reason they built the U.N. HQ in New York :wink:

From: pmooney22
Topic: 2848 Message: 2848

A recent post of mine was inappropriate for this forum, please accept my apologies.

In an earlier post I had attempted to correct a fellow members misconceptions, but he has chosen to call me 'a liar' which aroused my anger and led to that post.

However to threaten another person with violence because they did call you a liar doesn't make you any less a liar - it just makes you a lying thug.

I hope you appreciate that I did not descend to that level.

Once again, my apologies, and I will make no further comment on this or the previous thread.

Thank you for your time, and a promise that I will stay 'on topic' in future.

2849. Re: Save the BBC World Service - please sign the Petition

You owe me an apology. You don't know me and calling me a Right Wing liar is beyond unacceptable. You don't know me.

This is what we are talking about:

"BBC World Service cuts outlined to staff"
"The BBC has confirmed plans to close five of its 32 World Service language services. Staff have been informed that up to 650 jobs will be lost from a workforce of 2,400 over the next three years."

The Macedonian, Albanian and Serbian services will be axed, as will English for the Caribbean and Portuguese for Africa, in a bid to save £46m a year. The BBC estimates audiences will fall by 30 million, from 180 million to 150 million a week."

Ref: BBC mobile:
http://www.bbc.co.uk/news/entertainment-arts-12283356

WHOOP-DEE-DO! Who cares. For this you call me a right wing liar? Really.

I as well have no dog in the fight. I don't know if BBC's reporting is slanted. I don't care. I do know when it was on SW, I would tune in, and it was boring. I also tune into Radio Cuba to test my SW radio and hear their slant for a good laugh. I also listen to Radio China, Radio Canada, Radio Netherlands, Radio Russia, Radio New Zealand and any English SW programs for fun more than my main source of information.

I don't dislike BBC; it's just not an earthshaking event to sign a petition. It is also non of my business. You should learn that lesson and butt out.

****
The BBC cut is NOT a secret right wing conspiracy to stifle dissenting voice. Are you crazy?
****

The small audience of BBC SW operations does not justify the expense. They rationalize access through the internet, cable TV and satellite radio is cost effective and provides better audio than SW radio.

Balkan, Caribbean and Africa gets screwed? Well why don't they start their own radio and TV stations? I am sure they do have radio and TV (no doubt funded by aid from America). You are welcome. Caribbean is close to North and South America and is sick with SW signals, as well as AM, FM radio and TV. There is no black out of info here.

Even in deep dark African there is satellite radio, TV and other SW stations that target the Continent of Africa. BBC will not be missed. Heck Africa is rich. I get a letter or two a day from an African Prince that wants to send me $30 million. May be if they stop sending out those emails and get to work educating their kids and work they would be a bigger success, you think?

BBC's decision is based 100% on BUSINESS. They figured out the listening audience was tiny, and it was a big part of their budget. They are going to cut out the less popular programing. That is how it works in the USA. A show or program does not get ratings it gets axed. That does not always mean it was a bad show, just not commercially viable. Should programing be funded by the public if it can't be profitable?

> "why are you swinging to off topic about PBS?"

My POINT about PBS was very relevant and pertinent. We in USA have FULL access to over the air BBC News via PBS TV. That's the point I was making.

You apparently want to draw some parallel with BBC & PBS as a right wing conspiracy?

The topic is BBC cutting some services due to budget, so let me educate you.

Facts about PBS and NPR, it is for the USA only, no BBC like "foreign service". BBC service cuts are for foreign counties. 170 million USA citizens make use of NPR and PBS, and their budget is a tiny fraction of budget of BBC. The funding for NPR and PBS is over 80% privately funded, where BBC is 80% Gov and "tax" funded. Both PBS and NPR are listener funded with voluntary listener contributions, community, state grants, as well as grants from Federal and corporation grants for the arts. Neither PBS or NPR get direct Federal funds. They are grants.

Each PBS/NPR station is some what independently funded by the community they serve and broadcast to. I'm all for NPR and PBS. My wife and I listen to their programs which are fantastic. We voluntarily contribute generously to BOTH OF THEM! Do you? Watch what you say, you don't know me.

If BBC was cut of all Brit Gov funds and "License Fees" (tax on the British Subjects) it would cease to exist. NPR and PBS can exist with out Fed funds. BIG DIFFERENCE! It is off topic and you took it there. Learn to read and think more before typing.

> "Aren't RW'ers targeting PBS funding right now with the
> budget battles"

Again you bring up RIGHT WINGERS? You have RIGHT WING Derangement Syndrome. Every time you hear something you don't like or think some one disagrees with you, you start yelling RIGHT WINGER LIAR? That is foolish. I think you need to evaluate your paranoia about right wing conspiracies and accusing strangers on the internet of being "right wing liars". So are you a left wing secular liberal?

I'm conservative when it comes to finances. Yes budgets have to be balanced, cuts made. I am NOT for cutting PBS grants, and you did not ask me, you assumed. As far as BBC I have no say. It's none of my business. Where do you live? What concern is BBC or PBS to you? May be you should learn to be quiet and listen more, talk less.

We have enough news outlets to present all views with out NPR or PBS being controversial. If they report the News, make it straight down the middle, FACTS ONLY... no commentary. NPR and PBS has GREAT SHOWS for kids and adults that is worth support that is not controversial.

The recent firing of 10 yr veteran NPR reporter Juan Williams showed how ideologically driven NPR news was internally. If they fire people for voicing a reasonable opinion, be it liberal or conservative, then I will stop contributing. PBS and NPR's stupidity will destroy it not the Republicans or "Right Wingers" as you call them. NPR and PBS have great shows well worth support. Their "News" is often slanted. That's OK, I don't go to NPR/PBS for news. However when they get into propaganda left or right, I draw the line.

BBC still reports WORLD NEWS and it can be accessed by the Internet, over the air TV and subscription satellite radio, even in the affected countries. As far as having BBC staff as a permanent Bureaus or foreign language programs (English for Caribbean and Africa), I don't think I have a right or need to sign any partition. What will 30 million do for news in Caribbean and Africa? There is SW programs in these areas as well as FM.AM.TV.Internet.

Goodbye, and if you reply, it should be an apology from start to end. This is no place to get political. There

are other forums for you to spew your bigoted conspiracy
spew.

> "Have a nice Day"

That is all you have to say after insulting me and making
stupid assumptions and straw man arguments?

You have a nice day.

Do something more productive, I don't even care to read your post that you spent lot of time on. Sorry to say, but I have lot more stuff to do than defending PBS/BBC on these forums.

I thought this was a degen1103 yahoo group not the bloody
media complaint center.

Bottom line is read on your own and get all the information
to ask questions yourself..dont be spoon fed by any media..

but of course we all have to be like programmed robots
from the media perspective,,.

Lets get to teh degen1103 radios and enough of this BS.!

Dear Nageswara Rao Routhu:

> "I have lot more stuff to do than
> defending PBS/BBC on these forums"

No one asked you, but have time to call me a "right wing liar". Next time you say that, do it in person to my face keyboard hero. You assume and attack people you don't know, you troll.

> "I don't even care to read your post that blah blah..."

That is right you don't read. You lost troll; now run along. You embarrised yourself.

Have a nice day.

Wow two radio stations! You convinced me! LOL!
Freudian slip on you part I guess, "BBC is a monopoly".
I agree. You are argumentative and pedantic. I don't
care. Do you have a google deficiency? Try:

"BBC monopoly on licence fee Sachsgate report scandal"

You have employees at the "free market" BBC making
6 million pounds (almost $10 million usd). BBC is my
hero, let me sign that petition!~

>4. The body that keeps an eye on the BBC (the BBC
>Trust) is not appointed by the Government. The

This can all be looked up on Google and is a matter of
record. The opinions you express are your own, nothing
more. You can blow all the smoke you want, I am not
buying BBC is some noble financially viable profitable
institution. It can't get out of it's own way. It is a
bloated bureaucracy that is an albatross and anchor on
the necks of England's tax payers. May be time to get
rid of the royals, the queen and that prince charlies.
Save a bundle on that crew. You realize this is 2011 and
you still have a Queen? Sack the BBC at the same time
you kick the queen to the curb, make a clean break of it.

That's a non sequitur. Do you have ADHD disorder?
Al Jazeerah had great access, they started the Egypt
riots and they are anti semitic and work with the
Islamic Brotherhood. As far as coverage ABC, CBS, NBC,
Fox, CNN, AP were all over it. In fact two of reporters,
for USA, one being female, were attacked by these lovely
folks there in Egypt. BBC who?

Your petition has NOTHING to do with coverage of Egypt.

First we have 50 states, but I don't expect a limey to know this, considering UK was the biggest imperialist in history. Save your anti American propaganda I don't care. UK is a third world country that will be renamed United Kingdom of Islam, soon. The most popular boys name in England last year? Mohammad! Enjoy Londonistan. Mean while BBC will report Islam is a religion of peace. Ha ha, dhimmitude will not be so bad for you.

UN is a joke, less than ineffectual, it's useless and often destructive. USA needs to stop wasting money on it.

Cheers.

Greg, I really didn't need to read Islamofobic crap today. Thanks anyway
for providing some. But now we had enough.
Most of us subscribed to this list for radio listening-related
dicussions. Not for your bizarre opinions on people guilty of not being
or thinking like you.
Stop the pointless flame NOW.
Let's go back to our hobby. Antennas, microvolts, power adapters and
radio waves provide enough peaceful and creative subject matter for our
list.

Thanks

Raffaello

You say anything about Islam that's in the least
not all goodness and light it is "islamofbic"??
WOW. Ha ha! I have studied Islam for 8 yrs, read
the Quran and Hadith, as well as three books on
islamic history and mohammad. You should try it.
I think you would find it very interesting. I
also extensively have travelled and will travel
again through the middle east. I have ZERO POINT
ZERO "phobia". That would imply some fear for
ignorance. I have neither one. What I stated was
fact. I think it is you who is afraid and want
to stick your head in the sand.

> But now we had enough. Most of us subscribed to this

I agree, that why it is not a place to post
SAVE THE BBC WORLD SERVICE SIGN THE PETITION.

That is not appropriate forum for "petitions". The
BBC World service is not going away, just a bureau
or three, losing about 16% of their coverage. Also
the argument did not involve you.

Have a nice day.

Funny you would say that. A Christian woman, Bibi Asia (look it up), mother of 5 in Pakistan, said Amen! She was sentenced to death by hanging for blasphemy against islam. When the Mayor of the province defended her, asked for leniency, he was shot by his own security guard and the Imams rallied protest calling for her death.

Why do we care about BBC? In defense of BBC (which is relevant to SW radio and "petitions") they did report this, to their credit, when many news groups ran the other way and ignored it, for fear of being "islamophobic" and people who make death threats and kill over cartoons. People who are afraid of the truth yell "islamaphobic" and silence free speech. Good job. Britain ignored and appeased Germany in the late 1930's. (Neville Chamberlain, look it up)

Now go sign the petition. I think I will now. We do need BBC in Serbia and Africa to report the Bibi Asia story. Sadly many people who live there are all for killing this woman for blasphemy against Islam. After all it is part of the Quran and Sharia law. No one was talking to you. I hope you learn something.

Amen to you Brother! (and I'll never be "phobic" to say that)

Death to fear and ignorance.

Topic: 2799 Message: 2861

my degen 1103 arrived this week and so far, i'm very pleased with it [:)]

i used the power adapter i already owned (mentioned below) to charge 2700mah batts in the radio and set the charger to 6v. plugged in and it started charging. i then unplugged, set the adapter to 9v and again it started charging. so it looks like it charges on both 6v and 9v.

saying that i'm still a little confused and after advice now on which of the 6v or 9v setting on the adapter i shoujld use?

stuart

From: Jorge
Topic: 2862 Message: 2862

I bought a Degen 1103 and I have the problem that you can see in this video:http://www.youtube.com/watch?v=suszGahe1VA

The numbers do not display well on screen and have to "guess" what frequency is being tuned.

Rather than see a line on the dial are 3, 4 or dozens of them.

It is well since I bought it after a few days it worked well and then started again with the problem.

Does anyone know what could be the problem?

Thank you very much and sorry for my english translator google

Many years ago, radiamateur Kenwood transceiver TS820 had the some problem. Frequency display some led elements were switched off. Thus the number 8 becomes letter C and so on. The problem was due to bad contacts of a connector. A Service Kenwood bulletin explained that it was enough to clean the male connector and the problem was solved. This happened to me.
I do not know if the De1103 having connectors, but it seems unlikely that many elements of a display fail at the same time.

I would try to recharge the batteries in a separate charger. And try again powering on the unit within a few days with them.

This could be a possibility to solve the problem, since the DE1103, I have the understanding of having issues with remnant semi-charged components in the circuit. Maybe I am wrong, but could be this....

Did you try RESET ?
If reset doesn`t help, take out batteries for 4-6 days.
And finaly: carefully open the radio,check for a good contact between the connector and a flat cable.
Make visual check inside a specialy where is display placed.
Hope it will help.

2868. Re: De1103 Problem SOS

Yahoo group: de1103
Date: 2011-03-04 15:55:24 UTC
From: Greg
Topic: 2862 Message: 2868

I would try all the previous suggestions first/

Low battery has never made my display fade. The radio
works right up to as long as it can and then shuts
down automatically (to not drain the battery). With
that said do make sure the batteries are charged. If
they have the typical 1200 mAhr you need about 10-11
hours of charge time.

I have followed this forum for a few year, and have
owned my 1103 for 4 yrs? I have only seen one or two
complaints of display issues. One was just the Signal
strength section was not working. It ended up clearing
up by it self I recall. I think TEMP affects the
display, cold temps makes the LCD fade. Make sure it
is room temp. My display has been flawless.

If you are brave (not so hard) carefully remove the
back of the case and check for any connectors to the
display. Just wiggle connectors gently. It is possible
the LCD is screwed in and distorted it slightly. If
you ever took a LCD and twisted, bent, slightly pushed
on the actual LCD surface, you make the display fade.
I had mine open years ago and forgot what it looks like.
It is possible as the case heats and cools it might be
distorting the display.

Not sure how to check if the display is being physically
distorted with out taking the LCD out or loosening the
mount screws (if it is screwed in or glued, don't recall).

If you don't want to poke around, hold the case at each
end and gently try and twist the case. See if that affects
the display.

Cheers

I am sorry but in my opinion (I hope to be wrong) the problem is not easy to solve. It seems like a bad contact or malfunction of the pll. Probably is a silly thing but is not easy got it.If you have a scope you can check the voltages on pins of ic's, Check all connection and ... good luck.Degen, as all chinese low cost electronics gadget, have often problems. On mine (probably the second series) is all ok for now but on every issue they try to spent less for production.Sorryi5wnn

2871. New Radio with Humble Pie

Yahoo group: de1103
Date: 2011-03-11 18:56:46 UTC
From: olefrijole
Topic: 2871 Message: 2871

I just received a Grundig G6 Aviator (hardly used, a few weeks old) from a nun who is moving on to another assignment. I cannot keep my jaw from hitting the floor.

First, I am the happy owner of a Kaito 1103. The 'humble pie' part comes from my poky relationship with Sister. She drafted me to volunteer at my church; we had language barriers to overcome but found common ground in our faith and prefrence for Nescafe coffee.

Now, the G6 is in my care and since I leave for work in a few moments I haven't the time to really peruse the manual. Did I read a post here comparing the '1103 and the G6?

Your help appreciated.
Joe

"Did I read a post here comparing the '1103 and the G6?"

There is a SEARCH function for the post on the group.
Search it with some key words. Try different words
but Grundig G6 will be a good start.

If you now own both you can compare them your self!

Your best bet is to GOOGLE... read the reviews
of the G6 and 1103.

I googled Grundig G6 vs Degen DE1103 and got
a few hits. Not sure if there is any direct
comparison, but you can read the reviews of
each separately and get a good idea.

There have been many comparison reviews of
under $150 portables including the 1103 and
Grundig products. The 1103 comes out well.
The Aviator G6 has the obvious advantage of
the Aviation (VHF) communication band.

Are you saying you don't have the manual?

Catalepsy in my 1103.
It has happened very often.
The button works usually changing the tuning frequency, but no sound comes out of the current station.
The volume button works normally raising and lowering the noise level with no sign of the station tuned.
It seems that the stage of signal processing can not find the audio stage.
The reset button turns off the radio but it still does not sound tuned station.
What has resolved and removed the battery for a few hours, then he returns to functioning normally.
Anyone know the remedy for that.
Grateful
Aluizio

Sorry it was an automatic translation from Portuguese into English made by google!

Catalepsia no meu 1103.
Tem acontecido muito frequentemente.
O botão de sintonia funciona normalmente mudando a frequencia, mas não sai o som da estação sintonizada.
O botão volume funciona normalmente aumentando e diminuindo o nivel de ruido sem sinal da emissora sintonizada.
Parece que o estágio de processamento do sinal não encontra o estágio de audio.
O botão de reset desliga o radio mas ele continua sem som da emissora sintonizada.
O que tem resolvido e a retirada das pilhas por algumas hora, aí ele volta a funcionar normalmente.
Alguem sabe o remedio para isso.
Grato
Aluizio

Hi - Does the same thing happen on FM, and when one uses the Line Out (J4).? It would also be a help to observe what happens at pin 9 of IC2 (TA2057N) when the radio is working, compared to when it is not. Sorry, I forget which way is which, but either pulling pin 9 up to +5V (pin 6) using 100K, or pulling pin 9 down to 0V (pin 8) will over-ride the muting of the TA2057N.
Regards,
Bob.
P.S. (Sorry - I don't know how all of this is going to come out in Portuguese). Deficiencies in the filtering around C403, C404, R401, R402, R403 can cause this problem.

□
Catalepsy in my 1103.
It has happened very often.
The button works usually changing the tuning frequency, but no sound comes out of the current station.
The volume button works normally raising and lowering the noise level with no sign of the station tuned.
It seems that the stage of signal processing can not find the audio stage.
The reset button turns off the radio but it still does not sound tuned station.
What has resolved and removed the battery for a few hours, then he returns to functioning normally.
Anyone know the remedy for that.
Grateful
Aluizio

Hi Aluizio - As the same thing happens on FM and at the Line Output, it is probably the TA2057N not unmuting. When the radio is working normally and you change frequency, the TA2057N is muted - so no output to the audio stages - until IC4 (LC72137) - the PLL (Phased Locked Loop) settles down. There have been various comments about this over the years, but (from memory) most of them have been in regard to C403, C404, R401, R402, R403 being incorrect values, dry joints, etc.

I have never had problems in this area myself, but from memory you can stop the muting from operating (which could be handy whilst scanning, as you could hear weak stations) as mentioned before - by pulling up (or down - I forget which - I'm waiting for somebody to remind me) IC2 pin 9 to 0V or +5V via 100K.

So the easiest way out for you might be to disable the mute circuit by doing this - if you have the radio apart, then get it working - if 100K from pin 9 to 0V stops the sound, go the other way (100K from pin 9 to +5V), and then the radio should be permanently unmuted - sometimes a few squeaks and whistles, but at least it should start. If 100K to 0V doesn't stop the sound, that is probably the way to go.
Regards,
Bob.
P.S. COULD ANYONE OUT THERE TELL ME IF PULLING UP OR DOWN PIN 9 OF IC2 WITH 100K IS THE WAY TO PERMANENTLY UNMUTE IT?

Hi Aluzio,

The symptom you describe reminds me of what happens when you first turn the unit on with low batteries -- there's nothing but a soft hiss, but it goes back to normal once you turn the tuning knob. It sounds like you have a more serious problem because tuning doesn't seem to correct it, but have you checked to see if it ever mutes while using the power supply? Could your batteries be low, or if they're rechargeable, not taking a full charge?

Nelson

Topic: 2876 Message: 2884

Hi Nelson,
I'm guessing the problem is more serious.
I never use the power supply to drive a radio, but the problem occurs with fully charged batteries.
Sometimes the problem occurs when I'm just changing batteries with fully charged!
Thanks
Aluizio

Hi Aluzio,

The symptom you describe reminds me of what happens when you first turn the unit on with low batteries -- there's nothing but a soft hiss, but it goes back to normal once you turn the tuning knob. It sounds like you have a more serious problem because tuning doesn't seem to correct it, but have you checked to see if it ever mutes while using the power supply? Could your batteries be low, or if they're rechargeable, not taking a full charge?

Nelson

2885. Replacement Back Stand

Yahoo group: de1103
Date: 2011-03-19 23:19:21 UTC
From: Don Palmer
Topic: 2885 Message: 2885

I know there's been some extensive discussion about this previously, but I still have not seen a successful conclusion, more specifically to installing the replacement back stand.

I examined that very closely and using the thumb etc., to put a bend in that item, while almost lining it up that it could be pushed on and then released to pop the end axles in, appears to me to be an impossible endeavor, in that due to the bend it can not rest in that groove and successfully complete the installation.

And as for the tooth pick idea, that seemed plausible, but still does not afford enough bend to that back stand to accomplish getting both sides lined up to enter the groove.

If someone has successfully installed that back stand I'd appreciate a detail explanation of how it was accomplished.

Don

Catalepsy in my 1103.
It has happened very often.
The button works usually changing the tuning frequency, but no sound comes out of the current station.
The volume button works normally raising and lowering the noise level with no sign of the station tuned.

It seems that the stage of signal processing can not find the audio stage.
The reset button turns off the radio but it still does not sound tuned station.
What has resolved and removed the battery for a few hours, then he returns to functioning normally.
Anyone know the remedy for that.
Grateful
Aluizio

Sorry it was an automatic translation from Portuguese into English made by google!

Catalepsia no meu 1103.
Tem acontecido muito frequentemente.
O botão de sintonia funciona normalmente mudando a frequencia, mas não sai o som da estação sintonizada.
O botão volume funciona normalmente aumentando e diminuindo o nivel de ruido sem sinal da emissora sintonizada.
Parece que o estágio de processamento do sinal não encontra o estágio de audio.
O botão de reset desliga o radio mas ele continua sem som da emissora sintonizada.
O que tem resolvido e a retirada das pilhas por algumas hora, aí ele volta a funcionar normalmente.
Alguem sabe o remedio para isso.

Topic: 2885 Message: 2888

I am in an unusual predicament - I have also been waiting for a more definitive answer, but I have already successfully installed my replacement back stand.

It was such a pain, that I was convinced that there had to be a better way.

I used my thumbs and fingers exclusively. I didn't want to use pliers (at least without cushioning) to reduce the chance of stress at the edge of the pliers. Two things to remember: (1) Be more concerned about locating the pivot pins than over-bending the stand. Those pins are small and break quite easily, but you already know that. (2) Try to keep the bend radius of the back stand as large as possible.

It took me a good amount of hand strength to install it. I tried to line it up after it was bent by hand. I can only guess that Degen/Kaito has an installation tool for the back stand. Or they hire ninjas with bone-crushing grips. :)

Thank you Thad - I've been practicing with the one that is broken, in other words without the pins present and your right, lots of pressure with the thumbs and fingers - I can bend that enough to probably make the pins clear and get seated where they're suppose to be, but by golly, one of those pins (at least it seems to me) is going to have to enter first, then the other. The problem I am having is that with the bend, it's not going to clear that upper depression before getting seated in the groove between where the pins go. But if got it done I'll accept that.

Okay, finally success in installing the replacement stand - with radio in my lap face down, I inserted the right-hand hinge or pin into it's proper place, and in lieu of a toothpick, I used a small thin screw driver (but double the thickness of a toothpick) in the center of the back stand. Holding the right-hand hinge in place with press from my right thumb and hand, I took the left hand and applied enough press to get the back stand bending. I then watched to see if the hinge on the left-hand side would seat and clear the radio enclosure, which it did - carefully pulling out the screw driver, which took the bend out of the back stand, the left-hand hinge popped into its' proper place.

I scored the outer case of the radio just a tag where I had the metal small screw drive resting as the pivot point, but its cosmetic and not serious - I would suggest using something plastic or nylon in lieu of the metal screw driver.

(2) Try to keep the bend radius of the back stand as large as possible.Â
> >
> > It took me a good amount of hand strength to install it.Â I tried to line it up after it was bent by hand.Â I can only guess that Degen/Kaito has an installation tool for the back stand.Â Or they hire ninjas with bone-crushing grips. :)

The back stand can bend quite a bit without breaking. I drilled out the broken end on the one from my G5 and inserted a length of steel music wire to replace the pin. Worked great.

>
> Okay, finally success in installing the replacement stand - with radio in my lap face down, I inserted the right-hand hinge or pin into it's proper place, and in lieu of a toothpick, I used a small thin screw driver (but double the thickness of a toothpick) in the center of the back stand. Holding the right-hand hinge in place with press from my right thumb and hand, I took the left hand and applied enough press to get the back stand bending. I then watched to see if the hinge on the left-hand side would seat and clear the radio enclosure, which it did - carefully pulling out the screw driver, which took the bend out of the back stand, the left-hand hinge popped into its' proper place.
>
> I scored the outer case of the radio just a tag where I had the metal small screw drive resting as the pivot point, but its cosmetic and not serious - I would suggest using something plastic or nylon in lieu of the metal screw driver.

From: n3ham1
Topic: 2896 Message: 2896

I've been playing with my G5 and G6 more lately, so I broke the 1103 out of mothballs recently. It's still the best in my collection as far as being less prone to overloading (using the whip antenna of course), and being sensitive and selective on AM,FM and SW. It's a later production one with the improved audio. Just thought I would update my appreciation of this fine portable. Jerry

2897. Original PSU broke

Hi all after using my Degen DE1103 for a while the PSU that came with it has broke, so now using another PSU that delivers 6 volts as required but this PSU also gives a nice little hum that I can do well without.

Can any one suggest a better PSU that will not give out hum?

The one at present is a 6volt 500ma it was used to power an LCD DVD player.

TIA,

Mike.

hi Mike,
perhaps I suspect a primary break for the original psu .
always go for a linear power supply(the one with a transformer and , either two or four diodes.
the HUM can be reduced by ensuring that, across each diode , there is one 0.1uF disc capacitor.In the absence of these capacitors, there would be power hum noticed in the audio, on short waves also, when a station is tuned.
.
Also, it is better you have a regulated supply by using a supply of 9V AC transformer(that gives 12V DC)supported by an 7808 regulator chip with proper heatsink.
This arrangement helps to have a clean 8V regulated power to your radio.
All the best.

Thanks,

I am thinking between CCRANE SWP,KAITO 1101 ,KAITO 1102 and KAITO 1103.

I already have Redsun RP 2100,Grundig S350,Sony 7600G, So Please advice me the right choice .

Thanks.

I am happy with my 1103, but only on AM, it is hopeless in a location where there are a number of powerful FM stations. If it is FM performance you need where you do have a number of local FM stations, my pick would be the RP-2100. It performs very well using an outdoor antenna but there is more prone to overload with the inbuilt whip.

I'm within a half mile of practically every FM station that serves my metropolitan area. There's also a daylight AM station nearby. Even my HF xcvrs aren't immune from interference. Of all the small portables with pre-amped front ends I own, the 1103 comes out better than the 1102,G5,G6,911,or Redsun RP300 (same as the CC Crane SWP), and in that order. The Redsun's volume control has the annoying attribute of jumping from a lower volume to a much higher volume (for me anyway) in one button press. It necessitates using a volume controlled cord for your headphones.

I'm in a similar RF environment and agree the 1103 is one of the best for DX while not overloading - on AM, FM & SW. I love the RP2100 but it is de-sensitized on FM due to RF saturation. Can run it on FM only with the antenna fully collapsed.

Didn't like the little Redsun/CCrane RP300 for same volume reasons.
The G5 has almost the same guts as the 1103. Just a different control surface and associated logic.

No experience w/ other radios.

Mark

2905. DE1103 Overloading issues

Yahoo group: de1103
Date: 2011-04-23 12:43:56 UTC
From: ex_ex_ex_climatex
Topic: 2905 Message: 2905

Greetings folks,
I've observed some not-so-innocent overloading problems with my DEGEN DE1103: I was using the supplied 5 meter longwire antenna, attenuator switched off (that means, to the DX position) and tuned to various stations within the 3200-5000 kHz region, especially to the 4625 kHz frequency, which is known as the Russian "Buzzer" station (military/civil defense buzzing channel marker). I've experienced some sound distortion, especially with headphones on, sometimes also nasty intermodulation symptoms... For example: http://soundcloud.com/climatex/4625k - 4625 kHz is not a frequency for commercial broadcasters - this is a nice example of intermodulation due to input stage overloading.

I've also observed intermodulation on frequencies like 3873 kHz (two stations at once in a non-broadcasting band), or a 650kW longwave transmitter located 60km away from my place, transmitting on 270 kHz, was once found on my DE1103 at 10 050 kHz, which really surprised me - I have no other powerful transmitters in my area.

Well, my DE1103's issues appear only on shortwave with the external 5m antenna and with the attenuator in the DX position, switching it to LOCAL will fix these problems. The whip antenna does not cause these problems, plus LW, MW and FM bands do not seem to suffer from overloading/intermodulation at all.

I have been told that there's a fault in the newer circuit boards of the DE1103 receiver: the whip antenna preamplifier is connected also to the external antenna jack and this is overloading the input stage (the JFET transistor). Perhaps all DE1103s with the white-red CNR sticker in the front might be affected... I've tried to disconnect the preamplifier on the circuit board, it solved the overloading issues, however it introduced two minor quirks in the functionality so I reverted it back to the original setting.

Have you also experienced similar problems?

Best regards climatex

Here, pages 2 and 3 introduction to the problem:
http://users.hol.gr/~sv6czq/DEGEN%20DE1103%20modifications.pdfp

It firstly surfaced on radioscanner.ru as "degen de1103 mods", this PDF is a direct translation of the article itself.

2909. Loose antenna?

Yahoo group: de1103
Date: 2011-05-09 22:18:02 UTC
From: Greg
Topic: 2909 Message: 2909

I noticed my antenna was kind of loose....
so I took the screw out and carefully
squeezed the two sides (be careful there
is a washer). It tightened it up a little.

I put it back and it was still loose...
The looseness is where it pivots. Is there
a fix?

2910. Re: [de1103] Loose antenna?

Thanks TQ China wrote me from my post.

I tightened the screw in the back and
that fixed it. The whip antenna is still
too loose in the clevis fitting, but that
is OK. I can fix that my self.

TQ China wrote me back again and asked
for when I bought it. I think they may
just want info to see what batch was bad.

I have had it long enough to think it is
wear and tear.

Cheers.

Yes, there is a rumour that telescopic antenna
are a weak part of the Degen. I myself had to
change it once when it suddenly got dismantled...
bought 2 spares and used one. So far it did not break again.

Folks,
As a long time member of this group and long time contributor to radiointel I'd like you to check out my very own new website:

http://radiojayallen.com/

All my reviews and restoration articles are there along with some of my favorite links and I plan to be adding many new items in the coming weeks.

Please check it out and let me know what you think!

Thanks,
Jay Allen

2914. What a great radio

Yahoo group: de1103
Date: 2011-05-11 15:18:09 UTC
From: Martyn
Topic: 2914 Message: 2914

Hi,

I've just received my 1103 (from tquchina, arrived in 7 days), I was after a small SW SSB/CW radio to replace my ATS 505 which has never served its purpose and is the family FM radio now.

This radio fits the bill perfectly!

At just under £50 delivered I am amazed, dual conversion and a narrow filter that works, sensitivity is excellent. FM quality is exceptional, listening to Classic FM and a silent passage in the music is just that - silent, no hiss at all in the audio chain.

Well I bought it for CW (morse) and I can resolve stations on 20 m no problem at all, switch in the narrow filter and away you go. SSB resolves very well and the BFO is very stable.

I've read lots of comments on the keys and volume control being silly, no complaints here. The volume control is easy to adjust and the keypad is a nice change from the old 'telephone' style.

One thing I never read which I think is brilliant - the memories. Stores the mode (SSB/AM) with the memory and not split into FM, SW sections so I can flick through the memories and go from FM stereo to Ham radio morse code in one turn - fantastic.

Well, I'm sure you all knew this anyway but I thought I'd post it to let any potential buyers know that this is a great little radio. A great shame it is only for sale via ebay but maybe that is to our advantage!

I went back and tightened the screw at the
whip pivot and it's tight now. I had to get
a screw driver that fit better. Now all is
well, BUT I think I will take up TQChina up
on their offer to sell me one for $8 incl
shipping.

Thanks

PS:
To recap the two screws, one through pivot
and the one in the back an inch below the
antenna were tightened and all is good.

2916. Mine is 6" long...err....ferrite rod antenna that is.

Yahoo group: de1103
Date: 2011-05-11 21:47:46 UTC
From: Greg
Topic: 2916 Message: 2916

This may be common knowledge, but the ferrite rod in the DE/KA1103 is a full 6 inches long! I took the back off to look at my loose antenna issue (which did not require taking to back off to fix). That is not bad. There are two windings, one about two inches from the end on the speaker edge. The other coil is towards the other end.

That is not the 9" in a GE Superadio but it's not bad.

Just for your information, in my 1103 the plastic
area where the antenna seats (where there is a
hole for the screw) broke when handling the
antenna. I had to rebuild it with epoxi.

So, two weak parts, the antenna itself and the case...

Then add the poor encoder, the unprotected FET in the front-end...

Oh... I miss the times when SW radios were Made in Germany or in Japan!

Get a pair of REALLY good Full cup headphones and listen to FM stereo... AMAZING! I've never plugged mine into a stereo but I am sure it would sound amazing. Great FM tuner.

As far as MEMORY the programmer (you) needs to organize those into a logical order. I start with 99Khz, than all the FM stations, MW, than most used SW like TIME stations in USA and Canada, then I go up from 80 meter to 10 meter. It takes a little thought. The way they number it with numbers and letters is odd but you get use to it. If it's all written out on a paper it kind of helped me. As you say when you do search memory you have to scroll through them either up or down....

The VOL is the most funny because you have to push a button, However because the AGC is so good that it's set it and forget it. I kind of would like a mute ... but my work around is I run the speaker jack through a little amp and into headphones or speaker. That amp has a regular volume knob.

Thanks for the repair tip on the antenna Moisés,

What is this?

> Then add the poor encoder, the unprotected FET
> in the front-end...

Not sure?

Thanks.

PS:
You better look for some used Sony's before they are
all gone. They made many nice models, but as you know
they don't make much any more.

Hi. The encoder is the knob that you tune etc... with. Early DE1103s had problems with the encoder. Early DE/KA1103 radios also lacked static protection diodes. These diodes help protect the radio from damage from static electricity that gets into the whip. My KA1103 has the diodes from the factory, but my G5 did not. I added them to the G5.

See the files and [hoto sections for this group, and the Eton E5 group for mpore info.

Thanks for the advice.

The FM is the best I have heard for a very long time. I've just listened to Kraftwerk Autobahn express of BBC Radio 2 (a rarity) and it was exceptional quality.

I use cup headphones when operating but for portable listening I favour the HA-FX34 'marshmallow' headphones as I find their quality, fit and extremely low noise leakage very handy. I wish every iPod came with them!

I've started planning the memories on Excel and will start with your suggestion.

I agree with the AGC comment - very good. I have no issues with the volume control, I actually like it. My mute switch is the 'Off' button!

Does anyone have difficulty with overload on SSB? Sometimes it will be hard to tune (muffled sound) SSB as I think I am getting front end overloading. Wish the Degen had a AG control dial to control stronger signals.

2924. RTP-Radio Portugal will stop SW broadcasting "temporarily"

Yahoo group: de1103
Date: 2011-05-22 13:46:25 UTC
From: Bruno
Topic: 2924 Message: 2924

Hello,
Unfortunately one more SW broadcaster is considering to leave the shortwaves.
RTP-Radio Portugal announced that will close "temporarily" the Short wave broadcasts, starting on 01 June 2011.
On a press release, RTP says that it will be a test period, and only after that they will declare the final decision. Althought I think it will be difficult to reopen the SW broadcasts due to economic difficulties, I still have the hope that if many listeners write RTP-Radio Portugal requesting for SW, maybe they reopen the SW broadcasts on reduced airtime or on special events (soccer).

You can sign the petition requesting the SW broadcasts to continue on
http://www.peticaopublica.com/PeticaoAssinar.aspx?pi=P2011N9010
and you can also send an email to:
rdp.internacional@...
rtp@...
or send a letter to
Av. Marechal Gomes da Costa, 37-bloco B □ 2º, 1849-030 Lisboa, Portugal.

Thanks for your time,
Bruno
Portugal

It really seems ironic, never has the proliferation of low cost decent quality SW receivers been so great and the choice of SW broadcasting so diminished. I'm thankful that Radio Australia and RNZI are still active and readable in my area otherwise it would just be my ham activities.

Hi List,

I am hoping to buy a DE1103/KA1103 soon and wonder if anyone can recommend a dealer in Hong Kong/China for me to use.

Also I would hope to receive the radio within the next 4 weeks, this maybe cutting things fine!

Reason is have a holiday coming up then and it would be nice to have the radio to take.

Any advice or options welcome.

Peter,

Try to contact Ebay-seller SUNSLF in China. I bought mine from him and I had excellent service: The first came in with a faulty light, he sent me a perfect new one before even receiving my return.

Shipping was very fast too: China-to-Belgium in 2 weeks.

Kind regards,

Bruno

Bruno,

Thanks for reply.

SUNSLF looks promising. Did you opt for the EMS (faster) delivery.

Kind regards,

Peter

Peter,

Try to contact Ebay-seller SUNSLF in China. I bought mine from him and
I had excellent service: The first came in with a faulty light, he
sent me a perfect new one before even receiving my return.

Shipping was very fast too: China-to-Belgium in 2 weeks.

Kind regards,

Bruno

Hi List,

I am hoping to buy a DE1103/KA1103 soon and wonder if anyone can recommend a dealer in Hong Kong/China for me to use.

Also I would hope to receive the radio within the next 4 weeks, this maybe cutting things fine!

Reason is have a holiday coming up then and it would be nice to have the
radio to take.

Any advice or options welcome.

As far as I am aware, the DE has Chinese characters on the control panel and the voltage for the wallwart is 220V where as the KA the controls are in English and the wallwart is 110V.

Hi !

Nay, the control panel is written in latin characters, and wallwart sent
by Tao Qu to France are 220V, but perhaps are 110V in 110V countries.

Regards.

2943. Re: Are there any technical differences between the DE and KA?

Yahoo group: de1103
Date: 2011-05-25 15:30:53 UTC
From: Greg
Topic: 2932 Message: 2943

No I am pretty sure either brand comes with
buttons in English or Chinese.

I have a kaito and buttons are in English.
I see the Degens have English buttons as well.

The manual is on the web in English. There is
no technical difference. They are made in the
same factory. The difference when I bought mine
was Kaito was more prevalent and cheaper on eBay.
Now I see Degen is more prevalent on eBay.

In general the Degen is the North American import
model. Most of the USA radio dealers sell the
Degen brand name. That may have changed.

I think that is reverse (could be wrong), but from
my observation "Degen" was the North American Import
brand name (as sold by official NA dealers), and
Kaito was the eBay special ... and common brand name
in other parts of the world.

When I was looking 3 yrs ago it was Kaito all day
on eBay and Degen from the radio dealers in USA.
I bought a Kaito, English buttons, 110 wall wart,
from China.

Grey market? OK, may be eBay market, but it's all
legit and in the light of day.....

Grey market or gray market also known as
parallel market - is the trade of a commodity
through distribution channels which, while
legal, are unofficial

Sorry but you do have it reversed. Degen is one of the Chinese manufacturers, as ae Tecsun adn Redsun and KAITO USA is a North American importer for many Degen products. You may be confused by the fact that there are also some US-based eBay sellers who sell Degen products.

From: Greg
Topic: 2932 Message: 2947

You may be right but don't be condescending and call me confused.

It's irrelevant, they all come out of the same factory, so to the question of this thread, NO, there is no difference, except the brand name they slap on it.

We established that both DE and KA come in English, USA 110 volt versions. Fact, that is all we need to know. The rest is conjecture.

Please don't put words in my mouth. There is no confusion on my part. 4 yrs ago I could not find a discounted DE1103 to save my life on eBay. The Kaito KA1103's were more common and cheaper on eBay at the time than Degen, so I bought one.

Both Degen and Kaito are freely sold on eBay now.

I admit that the fact Degens cost more from dealers in the USA at the time, and Kaitos were cheaper on eBay I assumed the Kaito was the grey market brand. It is just opinion but not confusion. I can assure you I looked for a deal and went with what I thought was "grey market" at the time, a Kaito KA1103

****
Amazon sells many DEGENS as Kaito. Are they grey market?
****
Why is this Yahoo group called DE1103, not KA1103; if Kaito is the main brand name in North America?
****
Don't know how marketing, distribution and sales of the China made radios works, do you? Does it matter? I concede!
****
IF KAITO IS MARKETING AND SELLING IN THE USA THEY ARE DOING A BAD JOB.
****

I admit I'm not sure (not confused), but you seem sure, so you win.

Cheers

please try ask : tquchina@...

I bought my 1103 from him straight from China and paid about half of the usual price. he sells them through ebay.
this radio is so cheap, that it might be best to buy a new one before trying to repair it... Buy 2 to be sure. If you ask any professional for the price of repair, it is usually more than 100 USD or EURos.
If you are a good professional, you might not need any handbook?
I own one 1103 in perfect condition.

Hi Aimo,

Thank you...^_^

Hi Arnab,

Per my known, the manufactuer (Degen company) doesn't provide the service manual for this DE1103 radio. But if you have any questions or anything help needed, please list here, there are many people are experienced and warm-hearted to help you in this group, and I will try my best to help you also.

Have a nice day!

Best Regards,
- Tao Qu

2953. I Have Plans On Getting A New De 1103 or Kaito 1103

Yahoo group: de1103
Date: 2011-05-29 21:16:28 UTC
From: Adam E
Topic: 2953 Message: 2953

I have plans on getting a De 1103 or Kaito 1103 for my shortwave radio listening. I like it cause I heard great reviews about that the FM broadcast band sensitivity is good on this radio, and the long wave band goes down to 100 kHz, and with a special tip you can tune it down to 1 kHz. I want to get this radio cause it maybe the best investment until I can get some more money to buy other radios. I listen to shortwave most of the time such as WWCR, and Radio China International, and Radio Havana Cuba, also I listen to pirate radio stations sometimes on 6925. Is this radio good for AM DXing, and SW pirate listening? Is this radio better than the Grundig G3 and G5? I also listen to weak signals on the long wave band at night such as non directional beacons and broadcast. Welcome me, I am new here.

There is a schematic in the "Files" for this group.

Hi Adam

I bought a Kaito KA 1103 on the strength of the radio's performance on FM, if you live in a metropolitan area where there are many FM stations, this is definitely NOT the radio for you. The sensitivity may well be good but its selectivity is very poor. It is very prone to overloading which is so bad, for DX purposes, the radio is next to useless. It does not matter if you are using the whip or an external antenna, the result is the same. Performance on MW & SW is excellent.

Don't read too much into any reviews you may find on any radio, treat them as a guide only. A performance review is only an indication as to how the radio performed at the reviewer's location. For example, if the reviewer lived in a location where there were few or no local FM stations, the overload problem would not appear.

If you want adequate performance on FM, the RedSun RP-2100 would be a better bet which I also have. This radio is also subject to some FM overloading using the whip antenna but will give very good results when it is connected to a three element outdoor FM antenna.
In addition, the RedSun is a slightly better performer than the Kaito/Degen on MW & SW because of its slightly better signal to noise ratio. Sensitivity wise, one radio is as good as the other.

The findings above have been based on what I found with living in a metropolitan area with 15 local FM stations and around seven AM stations located close by.

Hope this helps.

Paul
Christchurch, NZ.

Selectivity isn't really relevant for FM, because of the FM capture
effect. The strongest signal will always be received. I'm a mile from
the local transmitter and have never noticed any overloading.

Hi Leon

The ability of being able to hear a weaker DX signal in amongst the slop from local stations is relevant which was the reason I bought mine for. As it turned out, the performance on MW & SW more than makes up for the problem with FM. I only wish this type of radio was available when I started DXing in the 70s.

Only one local FM transmitter? You are lucky, that would account for the lack of overloading. I just ran a count, counting the one which came on air a couple of weeks ago, there are 21 locals on FM plus numerous low power FM stations all over the city.

As I said, The FM capture effect is inherent to that type of modulation
and there is no way round it.

Dear Tao Qu,
Thanks for your reply. My Degen1103 radio is destroyed by the chemicals inside batteries. It happened when the alkaline batteries were accidentally put on charging. Now if the batteries are connected display is there but the radio cannot be turned on by switching on the radio.I think the keypad below the display is damaged. Can it be repaired?

please try ask : tquchina@yahoo.com

I bought my 1103 from him straight from China and paid about half of
the usual price. he sells them through ebay.
this radio is so cheap, that it might be best to buy a new one before
trying to repair it... Buy 2 to be sure. If you ask any professional for the
price of repair, it is usually more than 100 USD or EURos.
If you are a good professional, you might not need any
handbook?

I own one 1103 in perfect condition.

Hi Arnab. Possibly you could clean the chemicals out. Since these chemicals are dangerous and destructive in nature, chances are that the radio is beyond repair. If you do try to repair the radio, use rubber gloves and eye protection! If you get any of these chemicals on you, wash with cold water at once.

Good luck, and be safe!

First off, welcome to the group.

I have the Degen branded version of this fun little box. As far as I can tell, the major difference between them, aside from the name is the Kaitos are branded for the US direct market, while the Degens are available from China via Ebay and a few other outlets outside the US.

Here in central California I can easily, and with good copyability, pick up RCI out of Sackville with very little fading, though using this website - http://www.short-wave.info/ , I think I'm pretty much in the middle of the broadcast beam. Radio Havana booms in quite well here also. For antennas, due to heavy foliage and a relatively small lot in downtown Fresno I'm limited to the external whip and a TG34 loop, which works quite well inside the shack. The loop in particular does seem to null quite a bit of the RFI I have here. I've managed Austrialia and New Zealand on some nights.

AM broadcast seems to be okay, though I haven't gone looking for KOA out of Denver (which I could easily pick up on a '70s vintage AM/FM radio in a '73 Merc I owned 20 years ago). I have managed, though through a lot of RFI locally produced here in the downtown area, to nab Reno and Las Vegas on good nights, though with some fade.

As to the G3 and 5, I have no experience with them.

LW seems to be somewhat doable though with the antennas I have, it's not really fair to judge it. I do get Chandler Airport loud and clear, but as it's a whole 3 miles away, that's not really anything to judge the radio's capabilities by. I do hear a few others, but haven't ID'd them yet, so no real answer there as to sensitivity.

As to quirks, it does have a couple. The volume control is a bit awkward, but practice will make it a bit more instinctive. Memories, while there are plenty, are a bit awkward also. You can charge the supplied batteries while listening, but I have picked up a bit of hash from the transformer. It doesn't have an auto-charge feature, you have to tell it how long to charge. I really recommend a separate set of AAs and a separate charger.

Construction quality is pretty good, though there is a mod out there to shield some of the components that occasionally spit out some hash. Never really felt the need to perform the surgery involved myself though. I've dropped the radio a few times and the cat has provided more durability testing by pulling it off the table by the attached wrist strap. The radio is fine, so I don't see the need to feel too nervous about handling it.

All in all, if you can get it delivered for less than $100 US, I think it's a good investment, not only as a starter, but as a keeper. It does have the fairly small size which while not for a pants or shirt pocket, I've found it fits comfortably in a large coat pocket for trips and outside listening.

Hi Dennis. For an outdoor antenna, you might try some mini-coax cable run outside for a few feet. Connect a wire to the center wire of the coax and run it through the foliage. On the inside end, solder the center wire to the tip of a mono 1/8 inch phone plug. Solder the shield braid to the sleeve of the connector.

Similar antennas have worked for me in the past, helping get rid of some of the RFI from inside the house. I am fortunate to live where there is not much RFI. RCI, RNZI, and Radio Australia have always been easy to hear on the whip. RFI is the biggest problem for many Shortwave listeners today. That and the incessant t-storms here in the midwest lately!

P.S. Whilst I have repaired several of these radios, the cost of posting it to me (Australia) and return, is probably more than the radio is worth - so either way - if the above exercise doesn't do anything - it's time to count your losses!

Hi Arnab,

So sorry to hear this bad news...the battery charge function on the DE1103 radio is desigend for the Ni-MH rechargeable battery only.

If the pcb was damaged by the chemicals from the alkaline battery, maybe you need to replace the new PCB for it...

Regards,
- Tao Qu

Dear Tao Qu,
Thanks for your reply. My Degen1103 radio is destroyed by the chemicals inside batteries. It happened when the alkaline batteries were accidentally put on charging. Now if the batteries are connected display is there but the radio cannot be turned on by switching on the radio.I think the keypad below the display is damaged. Can it be repaired?

Hi Aimo,

Thank you...^_^

Hi Arnab,

Per my known, the manufactuer (Degen company) doesn't provide the service manual for this DE1103 radio. But if you have any questions or anything help needed, please list here, there are many people are experienced and warm-hearted to help you in this group, and I will try my best to help you also.

Have a nice day!

Best Regards,
- Tao Qu

please try ask : tquchina@...

I bought my 1103 from him straight from China and paid about half of the usual price. he sells them through ebay.
this radio is so cheap, that it might be best to buy a new one before trying to repair it... Buy 2 to be sure. If you ask any professional for the price of repair, it is usually more than 100 USD or EURos.
If you are a good professional, you might not need any handbook?
I own one 1103 in perfect condition.

Hi Arnab. Possibly you could clean the chemicals out. Since these

chemicals are dangerous and destructive in nature, chances are that the

radio is beyond repair. If you do try to repair the radio, use rubber

gloves and eye protection! If you get any of these chemicals on you,

wash with cold water at once.

Good luck, and be safe!

It's not too hard to clean up after a battery leak. Here's a suggested path:

http://www.ehow.com/how_5438045_clean-alkaline-battery-corrosion.html

I've done this before and never had a problem. Nor have I found the
chemicals that leak particularly dangerous, though I'd certainly keep my
fingers out of my eyes and mouth while doing this, which is just common sense.

Using the vinegar (acetic acid) neutralizes the strong base and prevents
further corrosion.

Good luck!
John

2969. 6 weeks old and the Aerial mount has loosened!

Yahoo group: de1103

From: Martyn
Topic: 2969 Message: 2969

Such a shame the whip antenna as come adrift of its mounting, the flange to keep the aerial in the socket has widened too much.

I've used a vice to put it back in (after removing it from the receiver!!!) and re-crimped the surround but I think once it's gone it will always be prone to coming apart.

I've seen others have purchased replacements - were these any better?

Thanks
Martyn

Martyn,
the antenna is one of the (several) weak points of this receiver.

Superb as the electronic design may be, the
construction of the receiver is flimsy and the
quality control is nonexistent, despite all the
"QC" stickers they may put on the radio.

Also I suspect they are using cheaper,
second-class semiconductors inside. This could
explain some sudden unexpected failures. I had to
trash one of the two DE-1103 I had because a
uncontrolable howling it developed in about two years of use.

Those lucky owners of a well-behaved DE-1103 should celebrate!

Tecsun seems to be producing more robust
receivers than Degen, but they suffer from the same lack of quality control.

Regards,

Moises

I've had no trouble with mine, but I am buying a replacement whip as a precaution. It only costs 7.90 USD plus 4.00 shipping from China.
Well worth it, I think.

A few years back, I ruined the whip of a perfectly fine Sangean ATS 803a by trying to squeeze the base of the whip to get it tighter.

Here's the link:

http://shop.ebay.com/liypn/m.html?_nkw=&_armrs=1&_from=&_ipg=25

Best,

RG from California

I have had mine 5 years and no problem. You can order a replacement as some one said.

If I may suggest you don't use the whip all the time up and down, in and out (no pun intended). Either set it up on a table with the antenna deployed and leave it, AND>OR use the plug in antenna, the 30' that comes with it. When you do handle the whip be gentle.

Better get the DE31MS, KA33, TG34 or what ever the number is for the amplified loop antenna, about $20 to the door. That is a FAR better antenna than the whip.

For FM I never need to pull the antenna out unless I am going for a 85 mile distant fringe FM station.

Obviously for MW it uses the internal loop (unless you do the "HACK" and connect MW to the antenna jack with some unofficial button pushing).

Can someone who has experience with these share the results? Are they any better than clipping a 10" wire on the whip, or using the supplied wire antenna?

Thanks
John

Hi - I have struck a couple of these, where the telescopic section and ball joint has actually pulled out of the fixed section in the case. It seems to be a matter of the amount of leverage one gets when the antenna is extended and is also in contact with the top of the case. Unfortunately, I have only two solutions - both involving removing the rear of the case (7 screws, including the one in the battery compatment - don't remove the screw at the base of the antenna until you get the back off.) Then you have the choice of replacing the antenna, or using a pair of side-cutters, carefully re-do the crimping below the ball joint.
I note that some people have suggested using DE31, etc. While these can help, under some conditions - if one is trying to DX in shocking conditions, it is notable that any receivers like the DE1103 have a front end which is "as broad as the proverbial barn door". There are several ways of overcoming this - obviously by putting a small amount of gain, with nice sharp tuning, in front of the radio - minimising noise pickup. The DE31 attempts to do this. An MFJ-1020(A,B,C) is perhaps a better way out for SWL (pricey - try 2nd-hand on eBay).. For MW/LW there used to be a similar unit which used a large, tuned ferrite rod with a small amount of gain - mainly impedance-matching - after the antenna. I forget who manufactured these, so I "rolled my own" - beauty!
Of course, to use the antenna input terminal below 1.7MHz, you must put the radio into the 0-100KHz mode, as described in many places. This engages the antenna terminal, and then you carefully tune to wherever.....
Sorry - maybe I've said too much - happy listening!
Bob.

All,

Thanks for the advice, much appreciated!

I will make sure the whip is not rotated vertically when the 1103 is in its 'reclined' position, this is the root cause of the problem and now I've found out the hard way, I can try to make sure I don't make the same mistake twice!

As I use my radio portable for Amateur band reception, the whip is used a lot but I will consider using a couple of meters of wire and a croc clip when I can.

The other alternative would be to 're-shape' the case by the whip so the whip can be vertical when the radio is laying on its rear mount but I think it would make a hole in the case so I'll steer clear of that idea.

I now have now found something good about my Sangean ATS-505 - it's case is curved so the whip can be rotated without damaging it, I knew there was one redeeming feature.

As to the build quality of the 1103. An old friend of mine worked in China for two years as a Quality Engineer and his words were.....

"China, though, is a not as expected. From the outside it's awesome and grand, but get up close and you see the lack of finesse and attention to detail. Unfortunately, this can also be seen in their manufactured products. Although capable, their standards, acceptable to themselves, are short of what we would expect in the west. Once you realize that you don't get overly disappointed with them."

So with those sage words I will sign off and order a replacement aerial for the 1103 I'm eternally grateful works well!

Martyn

>
> Hi - I have struck a couple of these, where the telescopic section and ball joint has actually pulled out of the fixed section in the case.Â It seems to be a matter of the amount of leverage one gets when the antenna is extended and is also in contact with the top of the case. Unfortunately, I have only two solutions - both involving removing the rear of the case (7 screws, including the one in the battery compatment - don't remove the screw at the base of the antenna until you get the back off.) Then you haveÂ the choice of replacing the antenna, or using a pair of side-cutters, carefully re-do the crimping below the ball joint.
> I note that some people have suggested using DE31, etc. While these can help, under some conditions - if one is trying to DX in shocking conditions, it is notable that any receivers like the DE1103 have a front end which is "as broad as the proverbial barn door". There are several ways of overcoming this - obviously by putting a small amount of gain, with nice sharp tuning, in front of the radio - minimising noise pickup. The DE31Â attempts

to do this. AnÂ MFJ-1020(A,B,C)Â is perhaps a better way out for SWL (pricey - try 2nd-hand on eBay).. For MW/LW there used to be a similar unit which used a large, tuned ferrite rod with a small amount of gain - mainly impedance-matching - after the antenna. I forget who manufactured these, so I "rolled my own" - beauty!
> Of course, to use the antenna input terminal below 1.7MHz, you must put the radio into the 0-100KHz mode, as described in many places. This engages the antenna terminal, and then you carefully tune to wherever.....

2976. 1103 while IN car using 'stock' antenna worked well / fyi

Yahoo group: de1103

From: abcaliasxyz
Topic: 2976 Message: 2976

Simply am reporting, what to me was a little surprising, - a normal reception for my 1103 while traveling by car using the external antenna that came with the Kaito. I was fully prepared to get only poor reception thinking the car chassis would cause some type of interference. It did not. I drapped the external wire antenna from the front passenger side window diagonally across the roof and down into the trunk (btw, none of this did any apparent damage to the antenna wire). I could even hear the CBers. Fred (Atlanta).

> even hear the CBers. Fred (Atlanta)

Interesting, it no doubt works for local CB'ers.
27 Mhz, center of CB band, 1/4th wave is 8.67'.
That goes into 30' over three times. So 30' is
about 3/4th to 7/8th wave. I am guessing SW
reception is not very good? (could be wrong)

I think the reception is more to the credit
of the excellent DE1103, than the antenna alone.

Did you try just the built in antenna extended,
with the radio sitting in the passenger seat?
Cars have lots of glass and it might work as
well? It's no doubt a trade off, longer antenna
horizontally polarized laying on metal verses
a vertical aerial.

Do you compare just using the built in telescopic
antenna extended in the car. Most cars have a lot
of glass. You might find it does as well?

Here is an idea. Get some PVC pipe and attach
one vertically to the front bumper, one to the
back, just enough to extend past the body of the
car. Stretched wire Ant out window, to the front
bumper PVC pipe (not laying on car), then back,
across the roof (if you can put some standoff),
to back PVC pipe. For CB you want about 35'.
I am beating you will get SW and even MW with this
set up.

If the front back poles were thin fiberglass rods
painted same color as car it would not look too
weird. ha ha!

From: ARNAB S
Topic: 2980 Message: 2980

Dear Friends,
My DEGEN DE1103 which was damaged(I Thought) by leakage of Alkaline battery is started to work somewhat. Thanks to suggestions by some group members. Now the problem is most of it's switches are not working properly. Volume knob is not working. on pressing it, radio get's switched off or on .Sleep switch is also doing the same.band+- switch is locking the keyboard. Hold key is also doing the same. Now I can only listen to FM broadcast at vol 40 nothing else. Can it be revive anymore. I have cleaned the pcb with water and iso-propyl alcohol then dried it using hair dryer at lowest temp. The radio didnot started as soon as I switched it on. I put in new battery, used thr RESET switch multiple times but nothing worked but somehow it started to show the time which I later adjusted and it is working fine. I then applied SLEEP+RESET+HOLD+TIME Switch together a multiple times. Nothing happened. I kept the radio on the shelf and went to sleep. next day as soon as I put it on Fm reception I got. Now for last threee days it is working that way. no other improvement seen and i am looking for suggestions. Thanks and best wishes

Hi Arnab - Well, you are progressing gradually. Before you bother to get down to clean the push-buttons, which is hard work, and may also involve re-coating the conductive rubber with graphite from a pencil, you may consider - I had one unit which wouldn't reset properly until I pressed the RESET, and held it down while removing all power - easier done with a power supply and the batteries removed.
Regards,
Bob, VK2CAN.

2983. Inductive connection with outdoor antenna

Yahoo group: de1103
Date: 2011-07-03 03:25:04 UTC
From: Robert G
Topic: 2983 Message: 2983

My Grundig G 5--basically same as DE 1103--performs extremely well off the whip alone so long as my 45' outdoor antenna is connected to nearby equipment (a Panasonic RF 2800 and an antenna tuner). Signals are good; background noise is low. As soon as I disconnect the antenna signals drop off drastically.

On the other hand, if I connect the antenna directly, using the external antenna jack, and use the antenna tuner to boot, signals are strong but noisy, and maybe not as good as with the whip in conjunction with a long outdoor antenna.

How does this work? I am not sure why I am getting the results that I am.

2984. Re: [de1103] Inductive connection with outdoor antenna

Possibly you'd get the same effect by winding a few turns of insulated wire round the radio, connecting one end to earth, and the other end to the 45' antenna. This way you are electromagnetically coupling the antenna to the radio - hopefully transferring more of the electromagnetic signal than the electrostatic signal. The latter would contain more of the interference and other garbage.
Bob.

Wrapping wire around the radio would work for improving reception on medium wave because of the ferrite rod antenna, as the shortwave antenna is connected to the whip it shouldn't have any effect.

What? ha ha! I think some one touched on it. There internal loop antenna is for MW and the whip for SW...

So to be clear DE1103 is sitting there on whip only, on a SW Freq (or MW?). Then near by a Panasonic RF 2800 with a 45' wire attached is tuned to the same Freq, as is the Antenna tuner.

Regardless the DE1103 likes being around the Panasonic RF 2800... with the external wire. When you unplug the wire from the RF2800 the signal also drops on the DE1103?

If that is the case clearly the RF2800 some how as you say inductively or just out right transmitting a boosted signal.... Does it matter what the RF2800 is tuned to? Does it matter what Freq antenna tuner is tuned to? I'm assuming it is on the same Freq as the DE1103? I can see that the whip on the RF2800 RF front end section is leaking into the DE1103's antenna (whip or loop) acting as a booster. What if you move the DE1103 away from the Panasonic? How close are they now?

If this is MW it is well known that the loop antenna in one radio, antenna tuning "tank circuit" will act as an external inductive loop to another radio nearby.

WHY IS DIRECT CONNECTION OF THE WIRE ANTENNA NOISY?

Again SW or MW. The external antenna is only for SW unless you do the MW hack (button pushing not in manual). Wire antennas, especially true with out a good ground are NOISY..... A wire antenna with a BALUN and good ground will be much more quiet. Why the above is more quiet, I can only guess.

Loops are going to have better S/N ratio (lower noise) because loops reject or null signals off sides....

If you want less noise buy the active magnetic loop that matches the DE1103 (DE31MS, KA33, TG34).... They cost about $21 to the door. Magnetic loops use the magnetic part of the radio signal and thus a quiet antenna. The static is in the E part of Electro-magnatic waves or RF radio waves.

Well - almost.....
Yes, a tuned loop like the DE31MS is a distinct improvement over a length of wire, as the loop mainly picks up electromagnetic radiation - the wire picks up electrostatic, which is where most of the noise/interference/garbage is, but if you think back to valve radios, a ferrite-rod antenna was a hell of a lot better than even the best loop. The fatter the rod, generally the higher the Q, and the better pickup. If one wants to get rid of the last bit of garbage, a shield around the whole lot - earthed, but slit, so no shorted turns - has got to be the way to go. Actually, I have such a beast - 3/4" X 9" rod with many switched coils, an emitter-follower after the tuning gang (before the days of decent FET's) and it's still marvellous.
However, if you don't wish to go to such an extent (but why doesn't anyone manufacture these?), any low-gain, high-Q tuned pre-amp gives you one great advantage noise-wise, as the front end of any of these synthesised receivers nowadays is as broad as the proverbial barn door. They may be very sensitive, and their IF bandwidths may be sharp, but if there's enough garbage or interfering signal at the front end to cross-modulate with your desired signal, it doesn't matter what you do with the IF - the damage is done!
Bob.

You can achieve antenna gain over the stock antenna by just wrapping several turns of insulated wire over the whip antenna, and stringing the other end out as a random wire.

Given that the filtering in the Degen is not that of a 2000$ tabletop , at some point (probably not too far down the road) overload issues will overwhelm any benefit from a stronger RF input .

That having been said, it's a cheap experiment!

John

Hi Greg:

Thanks for your detailed exploration of this situation.

Answers to questions: I do not in fact have the RF 2800 turned on or tuned into anything. The Antenna tuner doesn't seem to have any effect on the signal to the G5/1103. But as soon as unhook the antenna from the RF 2800/ATU system, the signal drops off.

I tried the idea of wrapping coils of insulated wire around the wire and this does work in much the same way, except that attaching a ground to the other end of the wire, as suggested by one poster, doesn't help and in fact introduces noise. Using power from the AC Adaptor degrades the signal, so this is one of those battery only provides clean signal situations.

Have you tried the Degen magnet loop antenna on shortwave?

Thanks,

RG

Subject: [de1103] Re: Inductive connection with outdoor antenna
To: de1103@...m
Date: Sunday, July 3, 2011, 2:53 AM

What? ha ha! I think some one touched on it. There

internal loop antenna is for MW and the whip for SW...

So to be clear DE1103 is sitting there on whip only, on

a SW Freq (or MW?). Then near by a Panasonic RF 2800 with

a 45' wire attached is tuned to the same Freq, as is the

Antenna tuner.

Regardless the DE1103 likes being around the Panasonic

RF 2800... with the external wire. When you unplug the

wire from the RF2800 the signal also drops on the DE1103?

If that is the case clearly the RF2800 some how as you

say inductively or just out right transmitting a boosted

signal.... Does it matter what the RF2800 is tuned to?

Does it matter what Freq antenna tuner is tuned to? I'm assuming it is on the same Freq as the DE1103? I can see that the whip on the RF2800 RF front end section is leaking into the DE1103's antenna (whip or loop) acting as a booster. What if you move the DE1103 away from the Panasonic? How close are they now?

If this is MW it is well known that the loop antenna in one radio, antenna tuning "tank circuit" will act as an external inductive loop to another radio nearby.

WHY IS DIRECT CONNECTION OF THE WIRE ANTENNA NOISY?

Again SW or MW. The external antenna is only for SW unless you do the MW hack (button pushing not in manual).

Wire antennas, especially true with out a good ground are NOISY..... A wire antenna with a BALUN and good ground will be much more quiet. Why the above is more quiet, I can only guess.

Loops are going to have better S/N ratio (lower noise) because loops reject or null signals off sides....

If you want less noise buy the active magnetic loop that matches the DE1103 (DE31MS, KA33, TG34).... They cost about $21 to the door. Magnetic loops use the magnetic part of the radio signal and thus a quiet antenna. The static is in the E part of Electro-magnatic waves or RF radio waves.

--- In de1103@yahoogroups.com, "Robert G" <rgorsch@...> wrote:

>

> My Grundig G 5--basically same as DE 1103--performs extremely well off the whip alone so long as my 45' outdoor antenna is connected to nearby equipment (a Panasonic RF 2800 and an antenna tuner). Signals are good; background noise is low. As soon as I disconnect the antenna signals drop off drastically.

>

> On the other hand, if I connect the antenna directly, using the external antenna jack, and use the antenna tuner to boot, signals are strong but noisy, and maybe not as good as with the whip in conjunction with a long outdoor antenna.

From: sandyscamper101
Topic: 2990 Message: 2990

I own a Degen 1103 and looking to trade for Realistic DX-440 or Sangean 803A in good working condition. I use to own a DX-440 about 4 years ago, and enjoyed it. My Degen 1103 is in very good condition. Only issue is the flip stand in back came off, I still have it, but it won't snap in...tab broke. Degen has an ac adapter, carrying case. Works on all bands. The Degen originally replaced my DX-440, but I miss the DX-440 as like the older radios. So if anyone has a used DX-440 or 803A feel free to email me for possible trade. Non-smoker.

Hi,
one obvious detail to check is it the antenna
attenuator was not left in the "local" position by mistake.

Other than this, there are several reports that
strange things happen now and then to this
receiver. Try resetting it, several times if necessary.

If this does not work, try taking the batteries
out and wait for one or two days before
reinstalling them. Try resetting it once more and
see if the problem is cured. Some people reports
that this sometimes helps to solve problems arising from firmware errors.

Of course there is some possibility that this
will not help. Try searching in this forum to see
if somebody reported a similar problem and how it was solved.

Unfortunately I have read of several dead or
malfunctioning 1103s (I have one) and I suspect
they are using poor quality components to build these receivers

Please tell us about the results of your efforts

Good luck!

Moises

Hi Moises,
Thank you for your fast reply.I try to switch between Dx,Local and Reset for several but no luck.I try to search and read another topic and file which sharing can not found any case like this. On DE1103 Schematic I think may be malfunctioning is on selection between FM and AM mode.Any suggestion welcome please.

It sounds like a unique (unfortunate) situation. I think my de1103 (ka1103) is going on +4 or five years old, no problem. There are very few post like yours. With that said, electronic stuff does fail as you know. I always thought the switches and buttons were light duty, and they are. That is how they get a light, compact fairly inexpensive radio. I think what your doing is fine. Try to do everything you can before digging into it as you have, reset, switch cycling/moving even cleaning. It could be anything. Good luck!

Cheers

Seems like my reply to this post didn't take, so here goes again. Please check the Files section for '1103 jfet pre-amp replacement'. If you can do some SMT work you can fix your radio.I was able to fix mine with the same symptoms.This was a common problem with the earlier versions without the diode protection. Good luck. Jerry

I'm selling it because I haven't used it much. It's a great little portable for sure, but I never liked the lack of a Volume Control Knob. I'm thinking of using the funds towards the purchase of a Tecsun PL660. The Tecsun would be the 10th radio I've owned. I've sold all of the others (except for my favorite - a Palstar R30CC), and fortunately, I haven't regretted those sales. - Bruce

3007. KAITO KA 31 Loop Antenna

Yahoo group: de1103
Date: 2011-08-15 04:42:39 UTC
From: Robert G
Topic: 3007 Message: 3007

Hi:

Has anyone out there experimented with the KA-31 Loop Antenna (=Degen DE 31 = Kestrel W31MS)? I want to compare notes.

These were presumably designed to work with the DE ll03 and the Grundig G5 and Eton E5. I got the Kestrel version for 20 USD from China via EBay.

I used the antenna inside a somewhat noisy radio/computer room with a good deal of RFI. First, I put it on a suction hook on an external window, then later I had it hanging in the middle of the room. This is all inside a wood frame house, vintage 1955 USA. It works quite well in some respects. It is easy to tune. It is amazingly compact when you take it apart. Clever design. Everything would fit into a small cosmetics bag. So: very portable.

It works, and I can imagine it being useful in some circumstances. In my circumstances, however, it isn't any better than the whip and it is notably inferior to my 40' external random wire with antenna tuner. Rotating the loop I cannot get any detectable nulling of local noise. Plenty of local noise with whip and loop, much less with external random wire especially when tuned.

What have other listeners experienced?

3008. Re: KAITO KA 31 Loop Antenna

The DE-31 is reasonably good for its price...of course, location is everything. It should outperform a whip in terms of reducing local noise.

Here's a comparison I did between it and the ANLP-1, and I compared both with a 23 foot roll up antenna s well.

http://radiojayallen.com/sw-loops-degen-de31-vs-sony-anlp-1/

Hi!

You can make a loop antenna. It's easy and cheap!

See this link:

http://lw3esh.blogspot.com/2011/08/una-antena-loop-magnetica-muy-sencilla.html

It's in Spanish but with a little help from Google Translator you can read
in English.

My "2 cents" :-).
I have the the KA-33 which is simply the KA-31 plus AM reception. I have found the long wire that comes with the KA-1103 brings in signal as well as the battery powered KA-33 Loop. Therefore, my KA-33 is back in the box...don't know if I will ever use it again. There must be some locations/environments where the loop performs better....but I know not where.

I have a DE31, to use with my Degen 1103...
For home use, I have a homebrew loop.
The DE31 is however slightly better, but harder to tune. Especially in the Shortwave band.
I'd prefer to have a coarse and fine tuning. It only has the coarse. For travel, the de31 is great. you can fold it together, and the batteries last forever.
I can recommend it to everyone who uses the 1103 with internal or wip antenna. The DE31 will make a great improvement.

Basti.

Hi all,

I bought the DE31 loop just to try it out, since it was only $13. It works incredibly well for me, because I live in a very populated area (downtown Toronto high rise). A standad wire antenna pulls in way too much man made noise, esp. since the TV cable trunk line runs past my appartment. With the DE31 I can get rid of some of that noise and actually pull stations out of the mud.
Of course, when I am camping in the wilderness, the wire antenna works far better than the loop.

Cheers all.

A.

Therefore, my KA-33 is back in the box...don't know if I will ever use it again. There must be some locations/environments where the loop performs better....but I know not where.

From: n7xgr
Topic: 3013 Message: 3013

Group, I saw this post on the Eton E5 Yahoo Group.
http://groups.yahoo.com/group/EtonE5/message/2237
I have a Kaito KA1103 and have two questions about it.
First it appears that the AM (MW) band is dead, the shortwave
and the FM bands are OK. It indicates that Q14 (2SK544)
might have blown, this fet is connected directly to the
ferrite via windings, if it is the fet I have no idea
how it would blow and not the other fet for the
shortwave side in which more units have this fet (YJ-7)
blow because of static electricity. Is there any checks
I could do to confirm if Q14 is blown, when I connect a short
wire directly to the gate and have it tuned to the local
station (1270) I get a little audio from them but no
S Meter reading, normally this signal is full scale.

Second, I have located a source here in the states for
the 2SK2394 (Q1) but instead of the YJ-7 marking it has
a YJ-6. I see on the Spec Sheet for this FET that this
marking is for a current rating. The -7 has a 16 to 32 Idss
verses the -6 has a 10 to 20 Idss. Would there be any problem
of using the -6 instead of the -7? I would like to have
a couple of these on hand just in case.

I have the Sony 2010 as the main but the Kaito is more
handy in finding local electrical interference and
general listening and I have Icoms and Kenwoods in the
shack and pickup truck.

Topic: 3014 Message: 3014

Hi All,

I□ve got my Degen DE1103 at the begin of August.

It was called on the catalog of my dealer in France as DE1103B, why □B□,
because it□s a new generation □dixit the dealer□.

In fact it was made on May 2010.

As I do usually before use I put the 4 Degen 1300 mAh batteries in a Pro Discharger-Charger and noticed that one battery was dead.

No replacement was possible, nor discount.

I also noticed that the tag on AC Adaptor indicates DC in 8V 200mAh instead of 300mAh on the manual.

After contact by mail with Tecsun Shenzhen they said that is an error of tag. Quality control (!).

Batteries life:

I use 4 Energizer rechargeable AA-2650 (HR6) batteries, see Form No. EBC-8833 EU-D on http://data.energizer.com/PDFs/HR6-2650_EU.pdf , fully discharged and charged, giving 5.656V after charge.

I used radio (SW only and light Off) at 08 Volume with earphones 3 to 4 hours per day in 3 to 5 times and noticed that the life was 24 hours that is less than the Sangean ATS-909X (36 hours) and low-voltage cut-out was 4.560V.

In general, the DE1103 is an excellent radio, more sensitive and more
□greedy in electricity□ than the ATS-909X, twice cheaper and not noisy even
without DSP.

Best regards.

MichelB

Hi Michel. My KA1103 is a couple of years old. I get 27 hours of use before shutdown. I am using Kodak Precharged 2100Mah NiMH batteries. I found that the included batteries and the Digital brand batteries had different full charge voltages. The Kodak batteries have very consistant full charge voltages (1.44v per cell). It seems that quality control is not what it should be with the less expensive batteries, as well as Degen/Kaito radios. I have been lucky to have gotten only good radios, but there are folks that have had problems right out of the box.

Enjoy your radio!

Topic: 3014 Message: 3016

Hi Martin,
Yes I enjoy my radio.

The full charge voltage of each cell Energizer AA-2650 (HR6) was exactly 1.442V, I've taken 1.4V according to Energizer Product Datasheet.
Time of use depends on volume, band - FM demands less energy than AM-SW - and low-voltage cut-out.
The low-voltage cut-out is different from one to other radio, see http://ukradio.info/Degen/ where they found 4.9V (4.56V for mine) and maybe less for your. This site gives some reviews about 1103.
Best regards.
Michel

P.S.:
1) For me the Degen DE1103 is the best little portable radio never owned, I hope that its life will be as long as my Sony ICF-7600DS and ICF-2001D 20-25 years old.
2) "Quality control" was not for the batteries nor for the radio, only for the tag error.
3) It is evident that you can't have a same global quality for a radio at $100, $240 and $320 even they are made in China, but I repeat that it's the best little portable never owned.

My charger says 250 mAh at 8 volts with 110 AC 60 Hz in. Radio is about 3-4 yrs old. The nominal current drain of the radio is about 75 mAh or less. Of course using speaker, higher volume = more drain, They way you use it, low vol, ear-buds on SW drain is way less. Still your 2650 mAh batteries are no where near that, at least in the DE1103. I explain below. Although the "max" or nominal drain is 100 mAh in the manual would indicated 26 hours of use with 2650 mAh batteries. The issues is how they rate batteries and the min voltage the DE1103 will run at. NiMh battery ratings are hype, is the other issue. High ratings on the label does not mean much sometimes, except they charged you more. Not saying they are all the same, just that 2650 mAH is WAY optimistic. The 1300 mAh ones that comes with the radio are more realistically rated. Playing it hard with the speaker loud I can get +9 hours of use. They way I use it, that is well over a month.

The chance is your wall-wart IS only 200 mAh; the label is right, which is fine. The radio only draws about 100 mAh MAX per manual. Real world drain is much less. Charging is not over that 100 mAh. I am guessing charging draws 0.033C to 0.050C (C is battery rating divided by 1 hr). So we are talking 1300 x 0.05 = 65 mA. The total of radio plus charging at the same time, is less than 200 mA.

I have doubts super high capacity NiMh can be charged properly in the DE1103 even with a higher current rated wall-wart power supply. That is a different topic. The built in charger is a basic timer only trickle charger, which has pros and cons. I am sure they limited the charger circuit to a max current or 0.05C, which ever is less, just to prevent battery damage. I think 100 mAh is the max charge current.

I never charge the stock 1300 mAh batteries more than 11 hours. Keep in mind this is charging "dead batteries", meaning ones that no longer run the radio. That is far from fully discharged. Regardless charge time should not be more than battery rating divided by 100 mAh. If you are one to charge the batteries every few hours of use (I don't recommend it) don't charge more than the hours you used it from the last charge, eg use it 5 hours, charge it 5 hours.

Battery Life

If you are getting 24 hours on a charge, you are doing well. The dead cell out the box is a bummer. They should have sent you a new battery.

I get about ~8 hours to 10 hours on the original Dengan brand AA (1300 mAh), on speaker, set at vol 16, playing AM or FM stereo. I did some test when I first got it, putting it on sleep timer, 2 hours at a time. After 3 two hour runs, 6 hours total, I went to one hour or 30 min. Normally I'd get at least 9 hours. At some point the radio would shut down. The way I use it, I am sure I get more than 8 hours. In fact I measure battery life by months.

My normal use I get about month or two per charge. I only use it about an hour or two a week on average. These are the original batteires 3-4 yrs old, still giving me great performance.

I almost exclusively recharged the stock batteries in the radio with the stock wall-wart. I charge about 10 hours some times 11 hours. It is very convenient. I always run the radio until it dies before charging. I use the radio almost exclusively on battery.

I'm an electronic hobbyist and repair old radios for fun. I use the DE1103 some times like a piece of test gear, to check other radios or test gear for their operation. So I might have it on for a less than 5 minutes at a time. I do use it for SW, AM radio and FM stereo. With headphones the stereo separation is fantastic! I have Sennheiser HD280PRO headphones. The sound is just awesome. The FM radio is very sensitive, get a FM station out 90 miles with out much problem.

I agree it is a super sensitive radio at a very good price. I have nothing to compare it with on battery life, as far as portable SW radios. I agree battery life may not be what some want, but it's pretty good.

BATTERY RATING RANT

I find high rating numbers on AA NiMh batteries are WAY optimistic. I would not be surprised if so called 2650 mAh NiMh AA batteries are significantly less than that, especially when you consider how the rate them. Keep in mind the DE1103 will not run on 1.20 volts per cell. That is the STANDARD voltage they rate the battery to. I found when my NiMh's stop driving the DE1103 they are above 1.20 volts... lets say 1.28 volts. I find at that volts, the batteries are not going to last much longer, die fast. Some batteries die faster and sharply more than others. The battery rating is rough guess. How it works in a device varies. 1.20 volts at some fixed current drain is optimistic for most sophisticated electronics. It takes power to do the magic. This 1.20 voltage standard is too low for the DE1103 to run. This is not uncommon. They could add more batteries to get a higher starting voltage but it would make the radio bigger.

I get +250 hours from my GE Superadio III with 6 D's. I doubt it's more efficient... the solution is MORE BIGGER BATTERIES! 4 AA's is marginal but it works.

Alkalines tend to have a shallower voltage drop at end of life, so they will run longer than NiMh. Also Alkalines just have more energy than the best NiMh. They start at higher voltages, have better shelf life and they voltage drop is pretty steady, shallower, down to lower voltages vs NiMh.

I could be wrong. There may be some latest greatest NiMh that equal the Alkalines? I don't think so. If they have them, they cost a bunch, but high price is no guarantee of good batteries. I doubt the internal charger will charge these super NiMh batteires to full capacity. I REALLY LIKE NOT HAVING TO TAKE BATTERIES OUT... internal charging is NICE!

Standard AA Alkalies are 2900 mAh. I doubt there are any consumer NiMh AA's that match or exceed that honestly at any price. I find the premium for some of the high rated NiMh to be not value added. I think 2000-2200 mAh is about as good as it gets for NiMh in ideal conditions. Keeping in mind they rate them to 1.20 volts and we need about 1.28 volts per cell to get any useful operation from the DE1103. So you can de-rate what it says on the battery label by a good bit.

I found in my test when the battery was at a no load, voltage of about 1.28 volts would not run the DE1103 very much long after that. It would suck the voltage down to 1.20 volts fast. Letting the radio/batteries sit for awhile, the battery voltage would recover back to about 1.28 volts; then radio would run for about 5 minutes and shut down again. So if your

NiMh only chargers to 1.42 volts you are talking about 1.28-1.42 volts of useful power. Some of weaker NiMh batteries I have only charge to 1.39 volts; some of my good batteries charge to 1.45 volts. Of course NiMh drain on the shelf. After a few days even the higher volt NiMh settle down to about 1.40 volts. Watching voltage as they drain under operation in the battery, the voltage will drop pretty fast in the first hour or two to the 1.35 volt area (little higher). It will sit there for many hours, of operation. Then it makes a steady drop to about 1.30 volts. Then voltage drops faster. In the below 1.30 volt range, say 1.28 volts the batteries useful operation are almost gone, can't run the radio load and maintain voltage.

Some newer NiMh chemistry promises longer shelf life NiMh for long low drain applications. However it depends on brand, age, charger, the device how much time you get. The nice thing is we have NiMh. It beats buying Alkaline's, which I still do. In my smoke detectors, electronic thermostat, some clocks, weather station, things that are low low drain I don't use NiMh.

Most of those high NiMh battery ratings are HYPE and $money$ making sales gimmicks or fraud. I bought some 3000 mAh hours before I knew better. THEY WERE CHEAP (should have been a warning). They were no better than the 1300 mAh Degens. I do have a pair of 2100 mAh "Titaniums" that are my best pair. They run my wireless mouse for months. I have wanted to buy some higher rated batteries, but doubt they will charge inside the DE1103 fully, although I don't know that. The good sophisticated NiMh chargers can squeeze more into the higher capacity batteries that a trickle charger can't. So if using high capacity in the DE1103 means constantly taking batteries out, I will stick with the lower rating ones and charge them internally.

ANTENNA

If you did not get the matching active loop antenna: KA31MS, DE33, TG34 and/or other name brands but same antenna .... get one. It makes the 1103 an even better performer.... It's a very good compact active loop antenna, that runs on two AAA's. It's also power hungry. I get about 10 hours may be 15 hours of use on two rechargeable AAA NiMh.... I have no clue really how long it last. Despite a LED power light, I forget to turn it off more often then run the battery down. I might not use it for months, so when I go to use it, I just pop new charged ones in. However I don't think battery life is that great, especially if you had to buy Alkalines.

When the 1103 with the active loop is dialed in from the East Coast of USA, I get the world. It gives my TenTec RX320D and 75' random wire a run for the money. Obviously Canada, South America, Caribbean is easy. However Africa, E and W Europe, Middle East and New Zealand is no problem with the DE1103/KA1103.

Doing A vs B, the built in whip vs the active loop, SNR is much lower with the loop, as to be expected. It's noticeable. A faint but audible signal with the whip becomes a moderately strong signal with less noise. It's not a miracle device, just a good match for this radio and better than the mono poll telescopic whip. However you have to tune the antenna with a tiny thumb wheel and it takes the aforementioned batteries. I don't use it all the time, but it folds up into a very compact package, easy to travel with. I am sure a long random wire, high up away from noise will improve signal as well as this loop, but the loop is just so compact and works well it's great for travel or apartment dwellers. The 1103's use to come with 30' of wire, mine did.

Congrats.... Not sure what 'B' model means? There have been a few revisions over the years, mostly for the good to address little complaints some had.

QC can be an issue with China stuff. Some times it is dazzling good at ludicrously cheap prices.... some times it's Oh GEE what the @#$%, but still cheap. However a dead radio no matter how cheap is no joy. I think the battery issue and charger (which I doubt is 300 mAh) is minor.

If you want to measure the voltage of the charger under a little load resistor, try 60 ohms 1/2 watt resistor, see what voltage the charger makes. I got 60 ohms from 150 mAh at 8 volts .... V = RI, R = 8/0.15 = 60. See how hot that wall-wart gets. If you have two multi meters you can measure the current drain as well and see how good the charger is. I am sure it's up to the task. Put it on an oscilloscope and see how much ripple it has.

For grins I put the PS on the bench. I measured mine, 7.95 volts, drops to 7.89 volts under 160 mA load. The ripple is 0.03 volts with some high freq harmonic hash. It's a linear PS, not a switching PS, just by weight. Actually not bad for a little AC power adapter. To be honest, I never use it when listening to tell if it affects SW operation? I am sure the power-supply puts off some near field RFI noise if you put the antenna next to the supply. They may have done some good sheilding? Regardless I think 200 mAh supply is up to the task. I would not worry....

Yes, of course, I have it correctly installed, I can open other pdf files, and that's why it makes me a bit puzzled that I don't get theses ones opened.
Computers are sometimes mysterious ...

Hi Dominique

You're not wrong there computers have a mind of their own sometimes, try right clicking on the link and select Save As and download it.

I'm not a guru.
I replaced Adobe Reader with Foxit Reader (freeware)
Foxit is more light than Adobe and I haven't had any problem

3028. Re: [de1103] DE1103 Block Diagram

Yahoo group: de1103
Date: 2011-10-27 00:20:44 UTC
From: Jeff Murri
Topic: 3021 Message: 3028

The files are created with an evaluation version of a PDF creator. Depending on your version of Acrobat, it may not like the popup that comes up when you first load the file. Another possibility is if you've got JavaScript turned off within your PDF viewer.

I personally use Foxit viewer for Windows, and after the initial warning about an unregistered copy of the PDF creator the files load fine. As an aside, I like PDFCreator for saving PDF files. When you install it it shows up as a printer, and you can then print your file to it. Couldn't be easier.

As far as the files themselves, Dr Phil's site is very cool. A lot of great material. Going to send him a thank you email.

Hi Aluizio, Jeff, Ed and Paul,

Thanks for your advices and your comments abt my issue with the pdf files.

I installed Foxit Reader but it doesn't help more.

Just a summing up:

I use to open pdf files with Acrobat Reader X 10.1.1. It always worked.

The ones from <http://home.comcast.net/~phils_radio_designs/>
http://home.comcast.net/~phils_radio_designs/ won't get opened neither with
Acrobat Reader nor with Foxit Reader.

A try to open them with Acrobat or with Foxit freezes the PC window !

I don't understand any more !

HELP !

Thanks in advance

Really curious, perhaps privacy and protection Explorer setting.
Did you tried download the file and open the pdf.file after downloading ?

That is: mouse cursor on the file, right click, save the file as ....
You'll get the file on your hard disk now.

From: Tao Qu
Topic: 3021 Message: 3034

I downloaded the 1102 and 1103 block diagram to my desktop, I am using the full version Adobe Acrobat, when I try to open it, I get the message as following:

This document was generated with an evaluation license of Aquaforest PDF Junction. Documents generated with the full license do not generate this message.

Then I continue click 'OK' will can open it without any problem.

Followed I use the 'print' function print it again in a new PDF file, then can open it by the Adobe Acrobat directly without any message or problem...

Sorry for if any confusion because my English...^_^

Dear friends

The softwares work now OK, I can open the .pdf files, I don☐t know why but
both Acrobat and Foxit work
I switched the PC off and then in, and that was it !
I can easily understand that Foxit required the PC to be off and in to work
correctly, but why did Acrobat require the same ???
Another mystery !
All is well that ends well !
Have a nice day

Hi. It is possible that Foxit changed a registry setting possibly along
with installing a file that both programs need. This is common in Windows.

I downloaded the block diagram, and several files fron Phil's web site.
All opened in Ocular (in Aptosid GNU/Linux) without problems, and with
no pop-ups. Libbre-Office (axailable for Windows and Linux) will create
.pdf files.

Hi,

I've just bought a DE-1103 for use when I'm away sailing.

I'll be using it to listen to the shipping forecast, rugby scores etc. but would also like to use it, with a laptop, to decode Navtex and Weather fax.

Does anyone have any tips on using it for data modes? Any stations/freqs/times that are easy to pick up in the English Channel/Med? Software recommendations?

Simon

It's funny that you'd ask this question. I was just trying to decode some RTTY data via WinWarbler last night (also tried just MTTY which I think WinWarbler uses on the backend) without success. I've tried CW, PSK and RTTY.

The one big problem I'm having is the large amount of noise and big dB loss whenever I plug-in my little mono cable I bought. What I've setup is just a simple mono cable between the radio to the microphone-in on my laptop. But just plugging the cable into either headphone out or line out on the radio gives me all the noise.

So to answer your question - I've tried via a mono cable between the radio and laptop, and until I can figure out the increase in noise and decrease in reception I'm not optimistic.

My next step is to try a stereo patch cable, even though a mono cable is mentioned everywhere I read.

Hi Jeff. You probably need some attenuation between either the line or headphone jack on the radio. I have used my home-made digital interface to receive digital modes with my KA1103. The interface consists of a stereo connection on both ends connected through a 25:1 audio transformer (found in the junk box). You could also use a 1:1 transformer, with some resisters for attenuation.

Rat shack used to have a cable for connecting speaker/headphone outputs to the mic in on a tape recorder that might help. There is a lot of info about didital mode interfaces on the net that may be useful.

From: Robert G
Topic: 3007 Message: 3043

Hi:

I have done some further experimentation and found that the loop performs very well in the lower frequency bands. No surprise! I have found a placement for the loop that really does null out local noise in my location: However, it does not work at all on the 25m or 31m bands to my dismay; the noise levels are about the same as with the whip. On the other hand, the results are spectacular on the 49m; both the whip and the longwire with tuner are terrible with the noise I am experiencing now, but the loop brings in a bright clean signal, with noise suppressed to an amazingly low level. I haven't yet tried out the loop on the 41m and the 60m and lower bands, but I will do so since I was stunned by its performance on the 49m band.

Topic: 3007 Message: 3044

It does perform quite nicely in a noisy city environment. I've had good results between 5.5 MHZ and 16 MHz. It becomes less sensitive above 16 MHz and it does not really tune below 5 MHz. The real advantage to this antenna compared to a wire antenna, is that if you live in an apartment (without proper ground, like mine), in a big city, the loop will get rig of a lot of man made noise. I can tune a weak signal with the loop, then replace it with the wire antenna, and the signal just gets buried under the noise. I'm quite glad that I bought it.

Cheers

3046. Re: [de1103] Re: KAITO KA 31 Loop Antenna

Yahoo group: de1103
Date: 2011-11-18 06:31:39 UTC
From: robert gorsch
Topic: 3007 Message: 3046

I have done some further quickie testing at my location--wood-frame house in a relatively quiet, low RFI American suburb. Receiver: Grundig G 5. Outdoor antenna: 40-45 foot (12-14 meter) random wire with an antenna tuner. I have found a pretty low-noise position and orientation for the loop--it took some trial and error; external window from the room was not it.

I can tune down to about 4430 khz. So I can cover the 60 m band and up. In my experience, I can get remarkably clean signals in the 60, 49, and 41 meter bands with local noise reduced to little or nothing. When I switch to the whip or to my antenna tuned random wire, I get a lot of noise and a signal that is ruined or degraded by the locally generated noise.

When I tune above the 41 meter band, the noise-nulling power of the loop just stops working. Then the antenna-tuned random wire does best. (No doubt this has to do with the kind of RFI I am battling. Listeners in other locations will have different results.)

But to my surprise, at the highest frequencies, the 16 and 19 meter bands and WWV at 20 mhz., the whip pulls in the best signal.

In conclusion, this loop antenna (KA 31 / DE 31 / Kestrel W31MS) is a great bargain and is very capable. The Kestrel W31MS works on both SW and MW; I understand that some versions of this product only work on SW. I bought mine from an exporter in Hong Kong for about $20.00 including shipping. Search EBay.

Guys,
My De1103 has suddenly gone deaf on all bands. It is out of warranty. Any ideas as to whom in anyone repairs these?

1. Check reception with headphones. At times, the Audio amplifier chip could go wrong.
2. Please check your battery condition. Check the receiver with a fresh charged battery.

3. If you can wield soldering rod, you yourself can do it,but carefully, Download from the files section, schematics and component layout diagrams. I suppose, if items 1 and 2 are covered and still the set is faulty, perhaps the power supply circuitry would be faulty. I could happily try to join you remotely if you are doing the servicing. perhaps we can hold on yahoo messenger chat and do it.

All the best

Joe,
Before getting inside, you can try :
1. Check with phones (possible audio amp failure).
1. RESET (the procedure appear in manual manual instruction).
2. If RESET does not help: take out the batteries for couple days.
3. If 1,2 and 3 does not help, try to operate with transformer.
Regards Dov aka 4Z5NU.

Shalom Dov,
I have not tried the first #1 (hi hi). I have tried #1, #2, and #3 as recently as last night. The radios produces only static on all bands and all modes. I am not sure if it relevant, but when I do the reset, the radio returns with the volume set at high (40)? I would think that it shouldn't come on full volume after a reset even if it is only producing hiss.
Joe, N9JCQ

My skill with a soldering iron on components that small is lacking I am afraid. . I will test with headphones tonight. I have tried it with new batteries, and on the power supply with teh same results. I let the radio sit with no batteries, disconnected from the power supply for 3 days and still have the same problem. I can let it sit for week and try it again.

Thank you all for your suggestions!

You are welcome...glad it might prove helpful....could you do us the favor of letting us know to what degree Kaito is helpful?
Details on my experience with Kaito repair: About a year ago I sent one of my 1103s in. Although I did have to call them after 2 weeks (had expected, & in my enclosed correspondence I had asked them to call me), they jumped right on it and THEY concluded that the cost of repair was not worth it .... because they knew I had incurred postage/shipping, they sold me a refurbished unit with a 90 day (I think) warranty unit for a-b-o-u-t $50.00 including shipping. I bought the refurbed unit and have had zero problems.

3059. Kestrel/Kaito/Degen Loop Antenna Manual from liypn

Yahoo group: de1103
Date: 2011-12-01 04:55:57 UTC
From: Robert G
Topic: 3059 Message: 3059

In his current ads on EBay, liypn aka V COM Computers mentions that a pdf manual in English or Italian is available for the Kestrel W31MS Loop Antenna (or equivalent). I bought the antenna about four months ago and have repeatedly emailed liypn requesting the pdf manual without result. Has anyone else actually seen this manual? I thought liypn was a reliable and responsive seller of Chinese shortwave radios and accessories.

3060. KA1103 shuts off-loose wire or ?? This happen 2 you?

Yahoo group: de1103
Date: 2011-12-06 01:58:17 UTC
From: ko
Topic: 3060 Message: 3060

Hello all,

I love my ka1103-I've had it for a while, I'd say 6 years but perhaps longer.

Has anyone had a problem where the ac adapter plugs into the radio, then if you say move the radio and the wire moves or turns the radio just shuts off? I have the original and a matching RS ac adapter, it does this with both.

Understanding there might be a crack or broken wire in the ac adapter, I'm thinking there might be a loose connection inside where the receptacle is.

Anyone else have this problem and if so, what was wrong and what did you do to resolve it? I'll eventually look at it, maybe a soldering gun kit is in my future. Thank you,

ko

Hi. While I do not have this problem with my KA1103 (I only use the adapter to charge batteries), it is a fairly common problem with laptops and other devices where the power jack is soldered to the circuit board. Eventually bad solder joints develop where the connector is soldered to the circuit board. Usually just reheating the solder joints will fix the problem (until it happens again after a few years). Do you have batteries in the radio? What type?

If you do resolder the connections, be careful to heat the joint only until the solder flows freely. Overheating can cause more problems. I would get a 30 watt or smaller soldering iron. You should read up on soldering, or if you know someone that has experirnce soldering have them help you.

Whatever you do, be careful and do not burn yourself or anything else.

ttyl.

3062. KA-1103 Problem

Yahoo group: de1103
Date: 2011-12-06 17:48:24 UTC
From: John H. Carver Jr.
Topic: 3060 Message: 3062

My unit is several years old. Five or six off the top of my head. Over the last year, while changing batteries, the unit locks up and must be reset to start, sometimes more than once. I tried plugging the transformer into it and was able to change batteries without it locking up. Now it locks up even with the transformer plugged in and I have to have the radio actually turned on to successfully change the batteries. Obviously the problem is getting worse and am hoping that the fix is something simple that I can do. Anyone have any ideas?

John

3063. Images in Long Wave

From: Adam E
Topic: 3063 Message: 3064

I would advise scanning 1711 kHz to 500 kHz for 2 seconds to 99 kHz to activate the external antenna jack, then use a low pass filter for the antenna to connect to the KA-1103. I did this and I got a chance to hear France on 162 kHz for the first time on this radio.

I believe, unless a problem is faced , we need not mod latest radios.
I suppose that they are subject to improvements in construction over a period.
if the problems described in kiws are noticed, one can try , but with caution.

3067. Test with ferrite antenna disconnected.

Yahoo group: de1103
Date: 2011-12-16 11:05:52 UTC
From: Michel Boulmé
Topic: 3067 Message: 3067

Hi All,

I tried to receive France Inter 162 kHz, a station 555 km distant from my location.

a) Ferrite antenna connected:

Signal is poor, no bar on S-meter but well audible and intelligible.

b) Telescopic antenna:

No signal and severe noise.

c) 31MS active loop antenna:

No signal and no noise.

My conclusion: No interest. (and you ?)

Reminder:

To disconnect ferrite antenna select 1711 by direct entry [1] [7] [1] [1] [BAND+] and scan down until the desired frequency [BAND-] for 2 seconds.

Best regards.

MichelB

Hi Michel,

I found that the 31MS does not work very well below 5 Mhz. The telescopic antenna is a bit short for LW as well. Here are a few ideas for LW antennas that you can make yourself:

http://www.mds975.co.uk/Content/aerials1.html

Cheers

My conclusion is your comment:

"My conclusion: No interest. (and you..?)"

This equals no interest in me commenting. No interest in what?

LF freqs are difficult to receive, and if you would bother to read the instructions, your 31MS antenna is good for (as advertised) to 3.9Mhz, which is a little optimistic.

162 Khz is LOW FREQ, at the bottom of what is considered LONG WAVE. Also we are talking a $80 radio with built in antennas and one external antenna, which has limits you don't understand.

Cheers

```
perhaps LW stations have heavy interference from local power appliances
that use chopper mode like grinder mixers, fan regulators, electronic
tube lights , etc.
However you might try from a little farther place like terrace or
less noisy place and with battery alone and with internal antenna.
```

Hi Greg,

you are right, specifications of Degen 31MS are as it follows:

MW: 531-1602 kHz

SW: 3.90-22.00 MHz

So I tried RAI Radio 1 on 1575 kHz 50 kW, a station 163 km distant from my location giving a stong signal at night but poor at day.

Ferrite: 2/5 audible

Telescopic: 0/5 audible, only noise

31MS: 1/5 audible

On the other hand, with the Wellbrook ALA 1530 loop antenna I can receive all LW stations even DCF77 but the antenna is too big for a room and my wife

I☐ll try to build the antenna described here:
http://www.vk2zay.net/article/47

Best regards.

MichelB

Where are you located and what antenna do you use?

Me too, I found it works better than ferrite antenna but with the Wellbrook ALA1530 loop antenna.

My experience is different. I tried external antenna and I found it works better than ferrite antenna. I receive many station I don't receive with ferrite or receive bad. The reception is very clear and loud. It works good whether in long and medium wave. I receive France Inter 162 kHz very well.

I use the radio telescopic antenna or a piece of wire. I've no special antennas. Sometimes I use a home brew amplifier with a fet (2N3819) but the radio is enough sensitive and doesn't need an amplifier. I don't use external antennas cause electrostatic discharge can damage the first stage.

Hello.

Is there a group for the new Degen 1106?

Or there is someone here who has it?

I'm waiting for my new 1106 from far east bought on Ebay.

73, Marco Bombelli IK2CHZ - K2CHZ

It looks as though the Eton E5 was originally known as the DE1106:

http://groups.yahoo.com/search?query=DE1106

It looks a bit different, though. Perhaps they are the same internally.

3079. Antenna connection

Yahoo group: de1103
Date: 2011-12-25 15:37:04 UTC
From: Michel Boulmé
Topic: 3079 Message: 3079

Hi All,

I☐ll build a kind of loop antenna like one can see here
http://www.vk2zay.net/article/47 .

I tested the feed cable of the Degen 31MS active loop antenna and it seems
that the connection is between sleeve and tip of the ☐3.5 mm stereo jack
plug☐, the ring is not connected.

But if I see the schematic that one can find at http://ukradio.info/Degen
--> Drawings, connection is between sleeve and contact number 2.

If sleeve is 1 and tip is 3 contact number 2 is the ring and according to my
test ring is not connected.

Anyone has an idea about that?

Best regards.

Hi Michel - We went through this some years ago - using a mono plug - sleeve earth, tip active - works fine, but only above 1.7MHz. Below 1.7MHz, the ferrite rod is engaged - unless you use the below 100KHz mode, and tune upward.
Regards,
Bob, VK2CAN.

3082. Battery TEST results - Long life NiMh rechargeables

Yahoo group: de1103
Date: 2011-12-27 01:38:01 UTC
From: Greg
Topic: 3082 Message: 3082

Well a few years ago I tried to compare NiMh rechargeables to the standard ones that came with the radio, the 1300 mAh and some new ones advertised to have 2900 mAh capacity. I purchased some GP 3000's off of eBay, thinking they would be great, but they were no better than the 1300 mAh, may be worse.... they were less than a buck a piece. Now I know two things: If you want great NiMh you will pay about $4.00 each (may be $2.70 in quantity (, and they will be made by Sanyo or PowerEx (IMEDION). NOW SKIP AHEAD TO TODAY...

I bought 12 PowerEx 2400 mAh batteries and a cool charger, La Crosse BC-9009 charger & analyzer (which can test batteries and tell you the capacity in mAh or Ah, among many cool features).

THE TEST!
I used NPR 91.10 Mhz, Stereo and VOL set to "16", a good listening level with speaker. I ran the radio until it shut down.

Stock batteries 11 hours
PowerEx IMEDION 2400 mAh = 24-25 hours!!! *

Battery analyzer:
Stock 1300 mAh batteries = ~860 mAh**
PowerEx IMEDION = ~2250 mAh

** The stock batteries are about 5 yrs old. Have not noticed appreciable drop off in performance but no doubt they are weaker than new.

* Also the stock batteries were used soon after charging. The IMEDION (PowerEx) sat around for a day or two. Their charged voltage was 1.49 volts after two days was 1.45 volts or so.

How FM stereo one vol relates to listening to SW and MW I don't know, regarding battery drain? I picked FM stereo and the 16 volume as a test point.

I am going to keep the stock batteries in the radio for a few reasons. The trickle charger built into the DE1103/KA1103 is only 100 mAh current. So it will take +24 hours to charge high capacity batteries. In fact it may never get them to full charge? 100 mAh may be too low for the high capacity batteries. My fancy new BC-9009 has variable charge rates, 200 mAh min, to 1800 mAh max. I prefer to use the lower rates just to be kind to the batteries.

As far as the GP 3000 (2900 mAh) I used them, over the last 4 yrs, got use out of them, but they were always lame... They were so cheap I did not care. They were fine for low drain items. All have started to die, don't hold charge voltage. The BC-9009 battery analyzer says they have approx 380 mAh capacity or less. LESSON BUY GOOD BATTERIES. Get the Sanyo (not the environmental "green" ones, not to be confused with Sanyo's that some times come in plain green cases with no label), or the PowerEx, IMEDION. I paid $32 for (12) 2400 mAh IMEDION AA's on eBay, ~2.67 each. All the GP 3000's are in the trash. I first got NiMh about 1996. Those batteries lased about 10 years.

My La Crosse came with (4) 2600 mAh AA's and (4) 1000 mAh AAA's. It takes over a day to test high capacity batteries. First it fully chargers (can still take 12 hours to charge even at 200 mAh). I could charge and discharge at faster rates, but I choose the min rate, 200 mAh charge and by default 100 mAh discharge. Once it calculates the capacity (mAh or Ah) it displays it, then charges them back up, ending the charge, discharge TEST charge cycle. The BC-9009 also has a refresh mode as well. It gives voltage and total time of charge or discharge cycles. Pretty cool.

So for those of complaining of low run time get some high capacity batteries. However if you do run high capacity plan on taking them out to charge them in a good charger. I like charging in the radio too much to be bothered. 7-11 hours of operation is enough, as I am around AC and can charge or run off the wall wart. However I use it on battery power 98% of the time. If I ever go camping away from AC I will put the IMEDION's in.

NOTE DON'T BUY BATTERIES CLAIMING THEY ARE 3000 mAh... I personally think the honest rating, MAX is going to be in the 2100-2600 mAh range.

Last, I am not selling anything... there may be other good brands of AA NiMH batteries, I am sure. However these two brands, Sanyo and PowerEx are two I can talk about.

One other point that should be made is that if you want rechargables that actually maintain their charge for any length of time they will not be rated higher than 2000 ma/hrs.

I have found that major brand names like Duracell 2650 ma/hr. will give you that extra time you need but they WILL NOT HOLD THAT CHARGE FOR MORE THAN A MONTH OR SO! While the "PRECHARGED" 2000 ma/hr Duracell will hold a full charge for almost a year or more.

Bottom line if you use your batts often and recharge them every month or less the longer Ma/hr versions are good.

B.

we are to initial charge the batteries, preferably as per manufacturers instructions, and may not be with the de1103 internal facility.
later once we insert in the radio, they would work better.

From: norsk4488
Topic: 3082 Message: 3086

@mvs:

It is always a good idea to bring the initial charge of new nimh to full before using them for the first time.

Also not critical but still important do not let them FULLY discharge. Most electronics that use rechargables will shut a unit off before the batteries are fully discharged but not all. I have noticed that if I let nimh fully discharge it greatly shortens the life of the batteries .

3087. low/ saturated volume with KA1103

Yahoo group: de1103
Date: 2012-01-01 15:01:58 UTC
From: Eric
Topic: 3087 Message: 3087

I have owned the KA1103 for quite some time, over 4 years I would guess. It worked fine until a year ago. I can no longer get much volume out of the radio, even at the highest setting. However, even though the total volume remains low at the maximum, and does change when turning up or down, I still hear saturation of volume when near the max even though the output I hear is low. I've tried plugging in an external speaker, but volume still low. I've also tried resetting the unit, but didn't make any difference.

Troubleshooting tips are difficult to find on this radio, which is why I am asking here.

Thanks in advance for any help provided.

Eric

Hi,
Did you try plugging in/out a few times 3.5mm pin in line out & headphone jack.

Did you tried reset the De1103 ?
Between sleep and hold buttons there is a little hole named "reset"
You can use a toothpick
I got twice my Degen working again after I reset the receiver.

Hi Ed and Vimal,

Yes, I have tried resetting the unit several times. Didn't help. I also plugged/ unplugged the external speaker several times. Like I said, I can hear audio and I do have volume control but everything is low. I start getting a lot of audio saturation and breaking up when the volume control is about halfway up (20), but even then what I am hearing is still very low. So it's like the audio circuits are working, but the full output isn't getting to the speaker.

Eric

How is the audio from the line-out jack? I was thinking it could be a speaker/phones amplifier problem.

If all other possibilities have been tried then there is a chance of a bad capacitor or audio amp, either one is easy to change out if the amp is to had. I would suspect the capacitor(s). Since the volume pads the audio and is often used it could break or a loose solder joint could happen.
Check these.... Volume control, bad solder joints, speaker, external speaker jack, capacitors in the audio stage,

3093. Hard reset

Yahoo group: de1103
Date: 2012-01-09 20:55:42 UTC
From: poikaa
Topic: 3093 Message: 3093

I have had the chance to work on several of these receivers and the "cousins" such as the Kaito KA-1103 and Grundig G5. I am sure there are others.
The ones that make it to me have "locked" up to where they are not receiving but just a weak static and other functions seem to work fine.
Pressing the reset does nothing no matter how many times or how long it is held down.
Here is what I do.... remove all screws that hold the front and back cabinet, pry apart gently, install batteries only! power the rig.... Carefully reach in th cabinet and disconnect the ribbon cable and reinsert....!
So far this has worked for me in four examples! Not knowing exactly what this does, I cannot recommend this for everyone! I would think it "unloads" a static "lock" condition. I have notified the "powers that be" about this and they are passing it on to the factory.

3094. Antenna Warning and Question...

Yahoo group: de1103
Date: 2012-01-10 19:08:35 UTC
From: james-joseph..
Topic: 3094 Message: 3094

I had my extendable sw/fm antenna become loose and I tighten the base screw to remove the floppiness and must have got it to tight. Now it comes right out of the base. The warning to others is to be very careful when adjusting the base screw or you will end up with an antenna that barely stays in one place.

Does anyone know how to fix this problem ?

When I first ordered and received my Kaito 1103 from Universal Radio, I received a defective unit with the same problem. So even the factory has done the same thing I did.

I really like this radio and have it's cousin, Degen 1121 a very good radio also.

Putting solder into the base would prevent its ability to swivel.

I am hoping someone has done this repair and shares the info with the group.

I may have to replace my 1103 with the newest radio wonder, the Tecsun 660. But I really enjoy the retro look of the 1103, and prefer to keep it in operation.

Thanks in advance to all who will reply...Joe in WVa...

Hi. Replacement antennas are available on the eton website, and on
ebay. Antennas for the E5/G5 are the same as the DE/KA 1103.

Thanks for the reply....I decided to take the radio apart and have a look. I agree that the only way to fix this is through replacement. I was going back into the message section and saw a ebay link...about $9.00 shipped. Will check other sites as well. To good of a radio to not use anymore over this issue. I would not mind paying more for a better design, if anyone has a link. Also had to do a reset after reattachment...Joe in WVA..

Date: 2012-01-31 00:39:12 UTC
From: stefy506
Topic: 3098 Message: 3098

Hy, my problem on Degen 1103, found a low low sensitivity 'bands 24 26 27 28 mhz.....I remember that once worked well even in high bandwidth.....The low bands 3.6 /7/ 14 mhz all very ok,sensitivity is good!!!Example = 27 mhz CB band, AM signal S9 with receiver Kenwood TS440---with DEGEN = just just you hear something.....
I have seen changes Radioscanner RU for extended low-pass filter around 30 MHz, but I think that the defect does not depend on this.
I recall a time I listened ok even in band 27 / 28 mhz ... now only the low bands .... very very strange.....Happens to someone the same problem? Sorry for the English, and 'was translated by google. Thanks Stefano.

Ahhh sorry sorry ....the problem exists with both stylus antenna with external antenna is for the desired frequency!!!!!! 73!

I think you will find that the top bands will be a little insensitive, on most of the radios that I have owned including communications receivers I've noticed the same thing. The best way of overcoming the problem is to use an antenna tuner or a preselector or both if you can.

Paul

I would also recommend using a resonant antenna for those frequencies. On my ten meter beam my radio wakes right up!

TKS Paul and Poikaa , I would like to tests done by other.I only use antennas tuned to the resonant frequency =ex 27and 28 mhz =I use GP for 10 mt band, 40 80 mt =i use dipole dedicate ecc ecc....I would like to try a preselector as recommended by Paul, I look forward checks and tests in these bands (27 28 MHz) by other fans, thanks.Stefano.

I am not sure of the input impedance of the DE-1103, I believe it to be around 300 ohms. When I use my ten meter beam (home brew) I can only use the center pin of the coaxial cable as it is 50 ohms nominal. With this configuration it becomes more like 300 ohms but the exact figure is hard to figure.
A preselector or matching device may do the "trick" to correct the ground plane's signal ringing or unwanted signal reflection. Ground plane design varies greatly and resonance may be found by the use of L/C networks that work in transmission circuits that can be a mismatch for the 1103.
My three element 10 meter beam uses a gamma match that is resonate from 26.5 to 29.0 mHz. It is all aluminum and all elements are common with the boom in that there is no insulators used save for the feed point of the coax. The gamma match is about 22 inches long with a buss strap to the driven element. It is made from two pieces of aluminum tubing sliding into each other with a poly tubing separator. All this is designed to be a proper 50 ohm match to the transmitter / receiver.
On my 1103 or any other receiver I use the center pin of the PL259 connector only and the mass of aluminum is a great signal "net" but still resonate at 26 to 29 mHz.

Ahi Ahi Ahi.....the problem seems to be fine now ... I think I solved!!!With the original external power supply sensitivity Degen 'much better now!In particular, the 28 MHz band!!!!!I will try tomorrow to 1.5-volt alkaline battery, not 1,2 volt NMH!!could be that the Degen 1103 requires to function at the top of a minimum voltage of 6 volts, not 4.8 !!!!! I'll give 'new information soon. Thanks.

Ha!
Low voltage! Yes it can make for some really interesting effects! But it is low on the cause factor in that one does not think of it as a problem!

Good job!

Hi:

Regarding the External Antenna Jack for the DE/KA ll03:

The manuals for the Eton E5 and the Grundig G5 explicitly state that the Antenna Jack is for low impedance, 50 to 75 ohm, feedlines. I am guessing that the same is true for the KA/DE 1103.

Outer diameter of the plug connector = 4 mm. / / The central hole accepts a pin of 1.5 mm.
Plug length =10 mm
These are measures of the external male connector, not the female socket of Degen! Ok?

Best 73 ! Stefano.

Martin-

A late thanks for your reply. I need to get a slimmer shafted screwdriver to get the back open.
I just charged batteries in the radio.
If I can't fix the connection myself I'll wind up getting extra sets of nimh's and my charger hany.

Thanks again and Best regards,

Kerry

3115. New KA 1103

Yahoo group: de1103
Date: 2012-03-14 08:08:25 UTC
From: richnlewis
Topic: 3115 Message: 3115

I just bought a Kaito KA 1103. I tell you that the radio I bought directly from Kaito surpasses any Short Wave Radio in Sensitivity and Selectivity I have ever owned. The most sensitive radio I have owned is a Hammerlund HQ-100 and and a Yaesu FRG-7 which I owned but pawned came close but was not as sensitive as the Kaito KA 1103. This radio on AM surpasses the GE SuperRadio III that I sold. And this radio was more sensitive than the Grundig G4000A that I own presently.

Several things I found out and have questions:

1.It says LW but it doesn't have a longwave band. Is there a special way to tune the radio to pick up Longwave?

2. How long does it take to charge up the Ni-Cads that came with the Radio?

I haven't checked to see if they had diodes at the Antenna input. I need to check this.

If any of you can answer my questions I would be much obliged.

all the best with a new radio thta you liked.
the replies are
1. diretly punch a value in LW range and press band+
thereafter tune various locations of that range.
2. 3. Charging time can be calculated as: Charging hours =
Battery Power (mAH) / 100mA (charging current).

and

3.there are no diodes as per some sch i had luckily.

Rich, This photo shows the RF board, look in the upper right corner where two diodes at the external antenna jack for static protection. If you unit is the latest version, these should be there.

3123. DE-1103 Latest Production

Yahoo group: de1103
Date: 2012-05-16 09:57:28 UTC
From: jallenhartford2000
Topic: 3118 Message: 3123

I just bought a new DE-1103 to replace one that stopped working. I had two from very early production and I also have an E5 and a G5 which are essentially the same radio with an enhanced user interface. The RF performance of the original DE-1103's, the E5 and G5 seems identical.

This newest 1103 does not perform as well on AM as any of the older 1103's or the E5/G5 which I still have for direct comparison. It seems that the internal noise floor is a bit higher on this newest sample.

Can anyone else here comment on recent production 1103's compared with earlier ones?

Jay,
I bought my DE1103 new in July 2010. It is a very strong performer on both SW and MW, to the point that I sometimes dare to compare its reception with my SW77 and ICF 2010!

Thanks,
Bruno floating in Belgium

Hi Bruno,

I know what you mean. I bought mine around the same time that you did. Once I got it it made my Grundig S350 look like garbage. (Aside from the sound out of the speaker).
As far as sensitivity goes, on an unmatched antenna, it seems as sensitive as my Icom R71.
Of course, the selectivity on the Icom is better, but I can't take the Icom on trips.
To me the DE-1103 is a great little performer. I bought it for $89US, shipping included.
Love this little unit.

Cheers

Andreas

Yo Hardrain - I had been on alert for this to happen to me as well.... and it did, even tho I was careful to avoid. Cause I didn't know where to go or even if it was possible to find the part I got lazy, I spose, and I just propped the 1103 up (~45 degree) with the non-extented antenna stem. I am just as happy this way for SWL, anyway cause I use the longwire for my antenna. Also, I had thought about just getting a clear plastic picture stander-upper from a dollar type store...but ended up happy enough with my antenna prop instead.
Happy listening - f.

When it happened to my G5 I just made a new pin with .050" diameter steel music wire I have lying around. I drilled deep into the stand lengthwise with a pinvise, then secured the wire with CA and cut it to length. That new pin will never give out.

It's stronger than the original plastic pin. I'd rather not have to remove the stand to photograph it since it requires bending it quite bit to get it out.

I'm a model railroader and I often use this method to repair and reinforce detail parts with wire as small as .015" dia., so this wasn't a big deal for me.

Hello all I am new here , just ordered a degen de1103 from amazon .com.
From what i'v been reading there was an older model of this radio that
had som rinkles in it, and in the new improved model all that has been
fixed.
My question is , how does one tell the diference from the old and the
new improved model? is there a serial number range to look for or something like that?

Hi Bob. As far as I know there are 3 "versions". The oldest has no static protection diodes installed. Next there are the older models that had static protection diodes added as a factory "fix" (the same old circuit board). Then there is the current version that has the anti static diodes installed on a circuit board designed for them.

There is no way to tell which except to (carefully) open the case to see. See the photo section for pictures. There is an RF amp stage used with the whip that is easily burnt out by static if the protection diodes are not present. The Eton E5/Grundig G5 have the same receiver board as the Kato/Degen 1103, but have a different interface.

I have a KA1103 (older circuit board with diodes factory installed diodes) and a G5 that I installed the diodes in myself. Both work great! I do not recommend trying to install the diodes yourself (if they are not present) unless you have some experience in soldering electronic components.

Good Luck and enjoy your radio!

Fall on the table , or from the table !! Such falls could create drysolders at the worst. Especially check the battery connections to the pCB.

Obviously, we need to be careful not to create further issues while opening for attending.

Thanks for the info Martin, I'll look for the diods When i open the thing up. My radio arrived in 4 days from Amazon, seems real nice.

I have uploaded a few pics of a replacement idea for the DE1103.... I did this to my Eton E5 but should be the same for the 1103.

73 Rod KB8DNS

I was given this idea from a user on the E5 group!

Here's the link I posted on the E5 group that goes directly to their site. If there's no minimum, it's a lot cheaper this way.

3152. vhf low band narrow fm tuning

Yahoo group: de1103
Date: 2012-06-26 06:20:56 UTC
From: Roberto
Topic: 3152 Message: 3152

Hi,
in Italy they are some intersting services on 70 - 68 mhz band.
the services are in Narrow fm. It's possible to tuning with degen 1103 ?
Exist some trick for force a "narrow like" fm (i.e. am with slope detection)

Thanks

Roberto iw2evk

3153. Re: DE-1103 Latest Production

Topic: 3118 Message: 3153

Hello Jay, I have a DE1106 latest version, with 2 months of testing in comparison with a tecsun PL660, I noticed that narrow band reception the radio lost listening stations in sbb.
Under 1700MHz in AM, there's a disturbing background noise such as intermittent, weak a listen, I need to increase volume.
I'm planning to buy me the DE1103, I found on Spanish market and the previous version.
You wonder if your DE1103 latest (red chinese label), presents same problems with my DE1106?
Thank you for the info, Regards Stefano IS0HSl

3154. Recent purchase = last year radio ?

Yahoo group: de1103
Date: 2012-07-06 13:37:54 UTC
From: tagoja2000
Topic: 3154 Message: 3154

Hi group

I just bought a De1103 from ebay (June 2012).
Nevertheless, when I opened the battery compartment the only reference to any serial number I could see is a label with : "2011/10"

No other number and/or letter is visible.
Do you think I should look inside at the PCB to see if it shows MarkIV or somothing like that?

I tried to insert a empty jack into the EXT antenna and the FM reception was noticeably attenuated.
According to what I read here it should be a NEW De1103.

Did it happened to any of you who bought recently a De1103 ?

73s
Marco

3155. A GREAT answer to the broken pop-out back stand :-)....

Yahoo group: de1103

From: abcaliasxyz
Topic: 3155 Message: 3155

Better yet, I would use this BEFORE the back stand breaks.
$4.00 + sales tax at the store...couldn't see the price on-line but here it is ~
http://www.michaels.com/Folding-Wire-Easel/fr0889,default,pd.html?cgid=products-framing-tabletop&start=15
This is a perfect fit with no impediment to the buttons at the base of the 1103 + the tilt is adjustable to any position from near horizonal to near verticle so that I can get the right lighting on the screen to be able to always see the channel panel without having to turn on the backlight facility. The white rubber coated stand causes no scratching to 1103 or table top. The metal hinges you see in the above link at the top of the Easel locate just above the 1103.
IN SUMMARY: It was if this Easel was made for our 1103s.

3156. Kaito or Degen ?

Yahoo group: de1103
Date: 2012-07-11 21:17:18 UTC
From: Gillis
Topic: 3156 Message: 3156

Hi

I am on my way to buy an 1103, which is better, Kaito or Degen ?
Are there any differences between those two.

I will like to go below 100 khz with the built in telescopic antenna, as we can see in this video.

http://www.youtube.com/watch?v=jgVC7jtwszQ

Is this still possible with a new xx1103 ?

Thanks in advance.

Gillis

It's my understanding that they are the same Radio. The Kaito is just packaged for the US market and you can get them domestically. When I bought my Degen the only source was China. I purchased it from one of many E-bay listing. Kaito will be more expensive but you'll get it quicker. My Degen took about 2-3 weeks before it was delivered. Perhaps others have more up to date info. My degen is 5+ years old.

I doint expect either DEGEN or Kaito, to work at 150KHz on telescopic antenna.
it only works on the rod antenna coil

I ordered my Degen 1103 from ANON-CO on Ebay on the 4th o0f July. It arrived here in New Zealand today, 1 week later. Not bad service at all!
I ordered from them because of the good feedback rating and they ship from Hog Kong.
Shipping from Hong Kong is always much quicker than shipping from China.
Just plugged it in to charge the batteries so haven’t had a chance to play wit it yet!

Grant, ZL2BK.

Hi Grant

You won't be disappointed, I have the Kaito version. If you have a lot of local FM stations (I'm in Christchurch) you will notice some overload but as far as MW & SW are concerned, performance is excellent. Radio Marti, Marathon Key, Florida used to be a regular on 1180 kHz before the Maori station opened on 1179 just using the ferrite rod antenna.

3163. de1103 set dead?

Yahoo group: de1103
Date: 2012-07-19 02:41:27 UTC
From: madyash_chat
Topic: 3163 Message: 3163

Dear all,

I just got hold of a new de1103, bought from eBay US. Looks like the set is dead. Tuning into any of the bands FM/MW/SW fails. The only sound I can hear is a constant hissing noise.

I tried resetting the unit; and also tried with different power options, like freshly recharged batteries and wall-power. But that didn't help.

Even the small LED under the 'SSB' switch does not light-up. Rest of the things (viz. the clock and LED backlight) seem to be working.

Any clues on what could have gone wrong?
Thanks and regards,
Yashdeep

hi, yeshdeep,
returning and getting a new replacement, togetger would cost a lot in the form of courier charges. you can get hold of schem,atic and pcb layouts ads download from this very site and attend to it.
in all probability the fet at the front end could be faulty.
try with external antenna where the FET can be byepassed.

Try the FM band and see if that works. If it doesn't, then it may be more than just the jfet of the preamp for the front end. When that goes, it usually just takes out MW and SW. Jerry.

Hello John
I have purchased a Degen 1103 years ago, he had the same problem few years after its use. What solved the problem was to remove the batteries for a few hours and it comes back normal.
It now has about a year he presents no problem.
Aluizio

3171. identify 450 khz "narrow" filter

Yahoo group: de1103
Date: 2012-08-06 06:28:56 UTC
From: Roberto
Topic: 3171 Message: 3171

Hi at all,

in the degen they are 2 filter 450 khz : one for wide and other for "narrow" reception.
i've order a most narrow filer on e bay

http://www.ebay.co.uk/itm/NEW-muRata-ceramic-FILTER-450IT-CFWLA450KJFA-450-kHz-2kHz-CFW-S450IT-/140814415347?pt=UK_Mobile_Phones_Communication_Radio_Parts_Accessories&hash=item20c93175f3

for change stock narrow filter.

But , wich of 2 filter it' s the narrow?
I've see the schematic, but i don't undstand how recognize on PCB.

Thanks

Roberto iw2evk

Hi,

today i've successfully changed narrow filter on board with new murata narrow filter 3 khz.
The reception now it's "sharp" in ssb and many noises are cut off.
i suggest this change in conjunction with input antenna modification and shelding from IRIS (radioscanner.ru)

From: Peter Lam
Topic: 3175 Message: 3175

Hi All,

Can anyone tell me where I can get a replacement knob for DE1103

3176. Re: Degen 1103 Knob

Yahoo group: de1103
Date: 2012-08-28 19:30:10 UTC
From: Wulf, George E UTAS
Topic: 3175 Message: 3176

I lost the knob to my 1103 during a camping trip. Whittled a flat edge on a small stick to fit in the 'D' shaped hole, then wrapped ¼" strips of duct tape around the stick until it was the same approximate diameter of the original knob. Sticks out a little farther than the original knob, but works great...haven't bothered to replace it.

3177. Downconverter for the DE1103

Yahoo group: de1103
Date: 2012-09-03 21:16:15 UTC
From: lucadrbiondi
Topic: 3177 Message: 3177

Hi! Anyone have tried to apply a downconverter to the de1103.
I think to get the IF signal at 455 KHz from the pin 21 of the TA2057N IC.
Then i'll try to build the downconverter found at http://www.qsl.net/kb9mwr/projects/voip/apco25/Simple%20455%20kHz%20to%20sound%20card%20IF%20design.pdf address.
The nice things about this downconverter is that it generate an I/Q output so i should use winrad software.

Any suggestion?

Thanks in advance,
Luca

Perhaps there are simpler ways to do it, like using NE612

Luca,

I think that's an ambitious idea.
I would suggest you take a look at Tony Parks softrock RX Emsemble kit configured for VLF work.
It's a pretty inexpensive route to what you're interested in.

At least in terms of IF output for DRM using DReaM, I believe the 1103
is not very good.

<http://sourceforge.net/apps/mediawiki/drm/index.php?title=Degen1103%2B17_Khz_Downconverte
r%2Bdream>

Perhaps other IF output uses would work better?

There are a lot of good portables that can be modified easily
for a 455khz IF output for DRM, to down convert to 12khz. You
can find the mods on line.

Some portables even have a 455Khz IF jacks. Don't screw with the
DE1103, get another radio to experiment on, is my advice. Cheers

For DRM, it can be made even simpler (and cheaper). Here is a simple downconverter I built up from parts salvaged from the junk:

even with DE1103 we can manage
the OP may noter that the IF ois 450KHz and NOT 455KHz.
thus we can make 462KHZ LO and use NE612 to convert.
A cheaper version could be possible with TA77358from Toshiba.
Though it was meant for FM front end, the device works for our purpose. I know of people from www.drmrx.org/forum who have madethis possible.
One member there 'siber' had designed specifically for DE1103 and he was using it.

Downconverter? There's already an excellent downconverter in the DE1103, it's IC7 ! I have no data on this 'IC' but it works just how you want on SSB. If you can modify the CIO, Q19, to run at 462kHz you have your downconverter, with 12kHz out of the LINE socket. I suggest you try replacing resonator U8 with a 470kHz resonator. The original 456kHz resonator is pulled down to 450?2kHz by the varactor VD2.

Hello,

apparently, Yahoo Groups does not allow linking to files in their own database :(

So I guess you'll have to find it manually. Go to the Files section of the group and have a look for the file named 12khz_Downconverter.png <http://f1.grp.yahoofs.com/v1/EGZIUNSMZK8cHl2_wMgQSiG7yxFFk360Oo4NIbf-J8\O6AFK4i_50ONTZzz8tJMsLHEsk42-71ESr3rLzDfxQP1oY8i1W/12khz_Downconverter.p\ng> . Once you are there, you should be able to open this file with a single click.

Sorry for any inconvenience and best regards,

Gerd

Nice idea Julian !!. Perhaps we need to retain both in order not to loose SSB facility. an extra switch is only wayfor that. that type COB chips are sold but a pair costs $16 or so.

Thanks mvs. I'm not sure what you mean by COB chips ..?
The SDR software will take care of SSB or any other mode you like! All comms rx have the capability for a 12kHz IF O-P but nobody thinks about it. I even used my old all-analogue FRG-7 tuned to give 12kHz and was able to decode DRM

CoB is , chip on board.
IC6 and IC7 are small pcbs with 4 edge connections on one side and three on other , . the components on the PCB would be a chip bonded , this is what i suppose. Might be, we can call them like child card placed in a slot on main board and soldered on each side to make up for 7 connections.
you are , right,
once converted to 12KHz, the software could manage the rest, even for ssb, cw, am, FMpresumably at 27MHz, DRM.
But the pc has to be on for just recing and manging the SDR facility.

Whittled a flat edge on a small stick to fit in the 'D' shaped hole, then wrapped ¼" strips of duct tape around the stick until it was the same approximate diameter of the original knob. Sticks out a little farther than the original knob, but works great...haven't bothered to replace it.

3194. Dead on AM bands - nar/wide switch

Yahoo group: de1103
Date: 2012-09-19 18:03:36 UTC
From: g4irx_uk
Topic: 3194 Message: 3194

I switched on my RX after a prolonged period of storage (and a few thousand air miles) to find it was perfect on FM but completely deaf on the AM and SW bands. After going through all the switch positions it turned out to be the narrow/wide filter slide switch that made it burst back into life again. I've been unable to repeat the fault symptoms since!

The receiver has been really useful during my travels in the US - Radio Habana Cuba on 5010 and RAF Volmet on 5450 heard in southern OH using only the whip antenna.

Nick.

The switch contacts were probably dirty and you cleaned them by exercising the switch.

The RAF Volmet on 5450khz must put out a very good signal - she comes in pretty well down here in the mid-evening just on the whip. I guess it's grey-line propoagation.

From: majoco21
Topic: 3177 Message: 3198

Not for DRM and not for the DE1103, but I made a SoftRock SDR converter for my Kenwood R2000 and using HDSDR software. Some modifications required to component values and crystal frequency but works quite well. There is a problem in that the receiver AGC is still operating and so turns the signal down to the same level into the SDR - I may have to modify the AGC circuit a bit but I don't want to risk making the R2000 have problems too!

Cheers - Martin - ZL2MC

if you stay in nations that work with 120V AC,
better buy or make one regulated 9V 1 amp adopter instead of using unregulated wall wart.
Always it is better to use linear psu, as you already know baout the noise created by SMPS supplies.

most locations, even a linear supply wont suffice as many other loads in the venue use choppers and smps etc.
regards
sarma

I am adding few morte lines.
if the adopter supplied is openable type, and if you (chris) are into habit of serviing ,

perhaps these trafos from China are generally wound two primaries.
For America , they parallel them in phase,
and for India like countries, they connect the windings in series additions.
If so, it should nbe possible to manage changing it.
how ever , i would only recommend a regulated supply at say (V Dc output for better life of the cells.

Hi - If you can find a 6 - 8 volt wall wart with the correct plug, and it's 120 volts input - go for it!
Don't forget the centre terminal must be +, and it's preferable NOT to use a switch-mode wall wart, as the amount of interference it'll cause in your radio must be heard to be believed. Also - don't use one that's capable of delivering 1 amp or more - the original one was only 300mA, and poorly regulated at that. Anything much larger may give rise to overcharging the NiMH cells, or else overheating the charge switching transistor (Q26 - S8050).
Bob.

the charge controller inside the DE1103 would take care of current and timing. IMHO , additional capacity on psu doesn't mean the load would take it.

Your receiver uses four AA batteries that total 6 volts, the power adapter is 8 volts at a nominal 600 mA. Volts can be considered a potential so under draw the adapter will float down to 6 plus volts.... the receiver can handle this easily. A smaller 6 volt supply may cause hum or poor regulation.
For the best supply for US mains, order a power adapter from Eton for the E3 or E5 as it will be the right one for the rig with out using a 220 volts to 110 volts mains adapter. It is also possible they may send one for free!

3211. Charger timer inoperative?

Yahoo group: de1103
Date: 2012-11-13 16:41:56 UTC
From: shane
Topic: 3211 Message: 3211

Hello all,

My 1103 charging timer disappeared from the display, that is, when you hold down the charge button to dial in the hours/timer to charge it does nothing. The "s-meter" just displays full scale but no charge timer. I took the NiMh rechargeables out and charged them in another desk charger/tester. They charged up and checked OK. Put them back into the 1103 and still no charge timer. Hmmmm. Did a reset, still no charge timer. The jog dial works for everything else, why no charge capability now?
Any eye-deers?

Hi Shane. Was the radio turned off? It must be off to start charging.
Otherwise possibly your radio is defective.

I am sure it is properly connected to the ac adapter. The batteries were dead and the adapter was running the radio. I know the radio has to be turned off to program the charge timer. Im going to try a different set of batteries and see what happens. Thanks for your ideas guys.

Hi Shane,

Have you checked that there is a voltage coming out of the 8V DC adaptor?
This sounds like what would happen if a DC voltage was not present on the
input.

Cheers,
Troy

Yes, voltage is present. I pulled the batteries out and ran off
the adapter all night. This morning I substituted a new set of rechargeable batteries. Same problem...no charge timer or charge display. The rest of the radio works fine. I guess I wont be able to recharge batteries in the radio anymore.

Topic: 3217 Message: 3218

Hi Carl.

I have just been experimenting with my radio, try this.

Type 29850, hit BAND+,
then store it in MEMORY.

Then hold BAND+ to start scanning up.

Very sensitive moment: be ready to stop scanning by touching wheel or
push ANY button when frequency goes beyond 30 000 - first digit
becomes like mirrored 6: Something like d0005. Store this new
frequency. Congratulations - you expanded or "opened" your DEGEN
beyond 29 999 kHerz. It is not so easy to do it from the first try,
start from saved frequency (29850 or near) again.

It took my a few tries, when you have done it store it in a memory.
Mine will receive up to 34.2 MHz.

Mine is also the latest radio, like yours.

Philip g7jur.

Hi Carl. What you are experiencing is probably strong AM broadcast stations bleeding through. I have had this happen only when using an external antenna. I suppose it could happen if there is one or more strong AM station(s) close by without an external antenna.

I never did see any reason to try to listen above 30 Mhz. 30-50Mhz is the VHF low band. There used to be many users of this band, but mostly they have moved to VHF high or UHF to avoid the frequent skip conditions of the last 2 solar cycles. Most users of the VHF low bands used FM mode.

I have not found much activity above 25 Mhz except CB (27Mhz) and the 10m ham band (28-29.7 Mhz). I seldom use an external antenna.

Good info Stefano, I just bought a 4mm/1.7mm DC to USB lead off ebay based on this info and it fits perfect. Item 251188390836 for those interested (UK Based seller) posts worldwide. I have no connection with the seller.
I can now charge the DE1103 via USB which is my preferred method as I take a laptop with me everywhere and saves on taking an extra AC supply/charger unit with me. Charge time will inevitably be increased due to the lower voltage but I can live with that.

Hi Cap. The full charge voltage of my NiMH batteries is 1.4v each. thats 5.6v for the 4 batteries. USB puts out 5v (I have not measured it though). I don't see how that will work to more than partly charge the batteries. Let us know how it works out.

From: Horacio
Topic: 3222 Message: 3222

I've learned from older posts that the jog dial encoder may be available, (TaoQ). Mine has become defective after 6 years of use, stopping at certain parts of the dial run.

Anyone can point out a source for the replacement if available?

Yeah, won't be the best, but seems to work here, my Ni-Mh Batts are 1.25v stock Degens.
I will report back on how successful it is.

Horacio and others,

I just opened up the encoder in my really old de1103. I flushed it with 99% alcohol and then placed a single drop of CLP on each side and then turned it around in both directions and put it back together.

Now things are back to normal! It does take a little bit of bending and prying to get the metal clamp off to get inside of it, but it worked!

I have had those encoder problems with mine for the last 5 years, and I just now got brave enough to tear into it!

http://en.wikipedia.org/wiki/Cleaner,_Lubricant,_Preservative

In the United States there is a product called "Break Free" that is excellent for use on many things including tight telescopic antennas, antenna connectors, etc. I do not know for certain, but WD40 might work as well.

The little metal clamp that holds the back of the rotary encoder on, has little teeth in 4 places. These must be bent out of the way and then the clamp can come off. Do not damage it however since it also serves as the ground connector. I de-soldered that connection first.

Once you are done, return the clamp to the back side of the encoder. Use needle nose pliers to squeeze the clip back into place. Re-solder that ground wire.

I hope this works well for. I'm pleased to have the radio working nicely again.

3227. Has The DE-1103 Been Radically Changed?

Yahoo group: de1103
Date: 2013-01-19 11:41:42 UTC
From: jallenhartford2000
Topic: 3222 Message: 3227

About 6 months ago I bought a new DE-1103 to replace my much older units. I had (unfortunately) given one away and the other later stopped working.

The new one is much noisier on AM than the original ones I had...sounds just like digital noises all over the band, greatly deteriorating reception of weaker AM signals.

Does anyone know if there have been big changes in the design of the DE-1103? I never heard any such noises on the original ones....they were superb.

Jay

I bought mine in August 2012 from eBay (seller tquchina). Very quiet unit. I can hear some noise but only if I put my hand on the display. Otherwise it's the most quiet radio I have (in its class).

Had it on charge for over 8 hours and don't think the voltage is high enough to keep the charge for the batts, just a small amount of charge so a bit disappointing.
For info it does power the DE1103 with the batteries removed (although below the spec'd 6v the battery indicator flashes as you would expect). I am also picking up quite a bit of QRN from the computer whilst plugged into the USB which is a shame.
Now reverted back to the mains charger :(

Well, it was an interesting idea, too bad it didn't work out. It would be interesting to see if solar cells could run the radio or charge the batteries...

I am not necessarily suggesting that you get a DE1102, but the USB should work to charge batteries or run the radio, as it only uses three NiMH batteries... A snap-on ferrite on the USB cable might help with the QRN issue.

I tried a snap on ferrite bead when I realised the QRN issue was there but it made no difference unfortunately.
Really like my DE1103, this is my second one after foolishly selling the first one. I use the Degen 31MS active loop mainly, which works OK (was never a fan of active loops), but is no match against my homebrew 500mm diameter Magnetic loop tuned with 2 x 500pf caps. I use the degen active loop mainly for convenience and causal listening but hook up the Mag loop for any serious DXing (low noise floor and additional front end filtering).

From: Jim
Topic: 3239 Message: 3239

I have not used my Kaito for several months, and the batteries were flat. I charged it up overnight, and it still indicated low bats; on inspection there was some corrosion at the terminals and at least one battery was discharged. I cleaned the internal terminals, replaced with alkaline batteries. The auto tuning moves, all switches work, and I hear the speaker, but never get a station (voice sound). Took it apart, checked connections, but still will not work. It is related to charging, because several months ago it worked fine. I like the radio even with it's odd manipulations, and would like to see it fixed. Any advice would be appreciated. Most modern electronics are not manufactured to be repaired, and there goes $80 or so.

Try shorting out the positive and negative battery terminals over night and press the reset afterwards. This may rid the CPU of the "battery memory". Use a 10k resistor as a bleed between the terminals, use two jumpers with alligator clips.
Seems the CPU design allows errant memory to accumulate and bears relation to the battery state. Almost like a static charge lock up.

Just now I have a short on the battery terminals, it has been without batteries since yesterday. Later (maybe tonight) I will try the radio again after a reset. I had tried reset several times. The sound I hear is a hissing when the volume is turned all the way up. Thanks to those who gave me advice. Since everything seems to work except reception, seems there can't be too much wrong, and related to power system.

I have read somewhere that allowing the batteries
to run flat produces such "battery memory"
effects mentioned by Rod. There are some urban
legends about the odd behavior exhibited
sometimes by this receiver (presumably
unpredictable software errors). The explanation
made by Rod makes a lot of sense

Good luck and keep us informed

Anticipating battery problems with my DE-1103 I have placed a thin plastic strip to fit between the battery terminals. This efectively "removes" the batteries from the radio without actually physically removing them. When I use the receiver I then pull this strip.
The radio's CPU programs memories in hexadecimal and this gives a total memory of 255 presets. It is possible that the design of the receiver uses or allocates more than just presets to the hexadecimal locations. Since the CPU also monitors battery voltage levels, it is possible the CPU uses memory as a comparator of voltage levels and through a possible software glitch it is possible the CPU "locks" in unpredictable ways. There is a reset procedure to remove all presets by holding down the SLEEP, HOLD and TIME buttons then hit reset. This will erase all presets but also may restore the CPU to default. Worth a try as the receiver is "dead in the water"!

I guess it's a gonner, tried all sugestions, still no reception. Speaker works, all controls seem to work, but no reception an any band, just occasional noise. Ordered an 1102 which looks easier to tune and operate.

Now that I think about it, I have a GPS for hunting caches (hidden items), and many people recommend charging the batteries out of the GPS, although there is an internal charger; they cost 4 or 5 times what these radios do. Maybe that is a good idea. I'm sure that is the cause of my problem.

Hello Roberto,

Got a simple schematic from radioscanner.ru
See "Photos" section.
Look for "Degen 31 ms" album.

Regards,
jan

For about $20 or what ever they are going for, buy one and take it apart. There are many many loop antenna designs and amps on the web. The design of the antenna I am sure is proprietary (not public). You can't make it for what you can buy one for. They work really well. Cheers.

I have to agree. The Degen loop antenna can be astonishing at times. My best experiences have been in the 49m band. I alternate between the whip, the Degen loop, and a 40 foot external random wire antenna. Upon occasion I have been able to get a very readable signal from Austria on 6155 or CBC in Vancouver on 6160 late at night in W North America using the loop antenna, where there is absolutely nothing audible using the whip or the external random wire.

Hello

Why active ? In my opinion the amplifier only ads noise to the signal, and it is not necessary on short wave.

Building a god preselector like this one

http://groups.yahoo.com/group/de1103/files/Preselector/

gives a better overall performance.

> Why active ? In my opinion the amplifier only ads noise to the signal, and it is not necessary on short wave.
The noise figures of modern JFETs and single gate MOSFETs are below 2 dBs. This is more than OK for shortwaves. The Degen loop circuit may not be very well designed for high IM values, but considering the low supply voltage, handability, size and price(!) it's a good option for travellers and people who cannot put up huge Beverage wires or dipoles outside their appartments. Compared to the built in whip it's far better in any respect.

> Building a god preselector like this one
A preselector is only one half of the story. You need a decent wire antenna outside the house far away from electric noise, too. For people who only have room for a small indoor antenna near or in a window, a tuned loop is not a bad choice, although there may be more sophisticated (and expensive and power consuming) constructions.

It works pretty good on MW.
I picked up VOCM in Newfoundland from the UK the other night using the Degen 31MS via the Ten-Tec RX320D, not a massive signal but shows you how capable it is on MW. It also has good directivity with some good nulling capabilities giving it an immediate advantage over a random wire.
Batteries don't last that long though which is a shame. I am sure that red power LED does not help being on all the time, I guess taking the LED out of circuit may increase the battery life slightly.
I was using the direct connection via a 3.5mm socket to BNC lead adapter I brewed myself to a Ten-Tec RX320D. The bandwidths on the RX320D are excellent for MW-DX.
SW performance is not bad either, certainly better than the DE1103 built in whip, but can be noisy.
For what it's worth the coupler is a bit fiddly unless you tape it to the DE1103, but it does work albeit a bit touchy to tune.
I bought another DE31MS as I was so impressed with it's performance (comparing it with my homebrew mag loop, not quite as good as that though), even not being a fan of active loops, it's portability and performance is well worth the money in my opinion.

Thanks for the nice writeup. I suppose for the cost it's easy enough to experiment. I never thought of using it with other rigs, though I have a good outside antenna farm for that purpose.

Best
John

Works quite nicely with the TecSun PL-660 as well.

3261. Lost all my shorteave

Yahoo group: de1103
Date: 2013-02-26 21:01:29 UTC
From: mike.lee059
Topic: 3261 Message: 3261

Hi all,
Having used the Degen DE-1103 for a good while now, I have never had any type of complaint against it.
BUT last week there was some sort of large static input from some where, no idea where it came from but it was noticed on 80 meters Ham band. Well any way, it affected my Realistic DX394 (now fixed) and my Degen, I have got all FM and Medium Wave stations all good and strong, but all my short wave bands are so week. But the thing that has amazed me is that the simple FACT is the Degen was switched OFF.

So now all I got is FM, MW good and strong, but all SW bands are so week. I have tried a 34` end fed antenna wire but no real improvement on any of the SW bands.

Is there any tying I can do about this? I mean for example is there a pair of back to back diods that protect the front end of the Degen DE-1103?
I don't have a circuit diagram so I am a bit stuck.

Any help please would be so good.

Thanks,
Mike.

Yes I agree BUT.... amplification works. The 1103 has an amplified front end. True it not only amplifies the signal but noise. Low SNR is always king. You just can't carry a long wire around traveling.

Apartment dwellers don't have room. I am a big fan of the Welbrook ALA1530S+ loop....Very expensive but well worth it. Back to the topic. The Degen, Katio or other brand (same antenna) loop works well, better than the whip at times. It is a bargin value. Neither are better than my 75' random wire high in the air with a good ground and BALUN.

I do agree there is no substitute for a good antenna (and earth ground). You can't fix a poor antenna with amplification. You can build a big unamplifed tuned loops and do some cool things. However using amplification you can use a smaller loop, taking advantage of the low nose chartieristics of loops. It is all about trade offs.

I DX over-air TV. Amplifiers are invaluable to overcome line loss in the coaxial from antenna to TV. Splitters are signal attenuation monsters, so broad band amplifiers are a must.

Interesting, I've been Dxing since I was 14, I'm now 75. Ive tried most so called antenna amps etc. including when living in London in the 90's. in a house that had not enough space for a good outdoor antenna.

I found that most where useless, its far better to string a wire around the window or room.

If your a serious MW dxer (Ive got Verifications from over 100 countries on MW including USA, and Latin America) and on SW over 123
countries (in all well over 1,000 Qsl's including many first's).

So allowing for the technology in today's radios perhaps the only thing that these so called amps do is let you hear more QRM, and my be increase the actual signal by no more than 2 on the S meter. as well as the static.....Dxing is the art of actually listening to the signal.

From: Henry
Topic: 3249 Message: 3266

> I found that most where useless, its far better to string a wire around the window or room.

This may have worked 61 years ago and it could possibly have worked in the 1990s. If you do this nowadays, the wire antennas inside the house will give you nothing else but S9+20 dBs of computer, lan router, plasma TV, powerline network, switching power supply noise from medium wave up to 20 MHz or more. A loop antenna responding to the magnetic part of the radio waves can improve the situation dramatically (although not compensate it completely).

A decent broadband magnetic loop like the mentioned ALA, a LZ1AQ loop or a e. g. in Germany very popular HDLA loop will certainly outperfom a Degen 31m style antenna in some cases (especially in respect of intermodulation), but this goes at the cost of price and power consumption. So in my opinion a small tunable loop like the Degen is a good choice for indoor reception. I do not own one myself, but I have experimented a lot with homemade tunable loops (among other antenna types) and I can assure you: They are not bad. And I bet they outperform any indoor wire or whip in modern noisy environments. Of course you cannot compare them with an outdoor antenna farm in a rural area.

Again on amplifier noise: The FET in the Degen loop is not mainly there for amplification, it is an impedance transformer at first place. Amplification is not so important. Below 20 MHz any noise picked up by that antenna is much higher than the noise from the transistor. In really quiet rural areas the situation above 20 MHz may be different. But if I live in a rural area with lot of space I do not go for a Degen (or similar) as the only antenna.

Henry

3267. Re: Degen loop on MW/AMBCB?

Topic: 3257 Message: 3267

I've tried a few of the Degen active loops and find they work OK but have a higher noise floor than, say the Twin Coil from C.Crane or the Sony ANLP-1, and the tuning is quite touchy on them, but for the money they are hard to beat.

One alternative for AM I really like is the MTM Scientific loop because it is large enough to really outperform the popular, smaller passive loops and being passive it adds zero noise of its own.

3268. Re: [de1103] Lost all my shorteave

Yahoo group: de1103
Date: 2013-02-27 15:38:32 UTC
From: Martin
Topic: 3261 Message: 3268

Hi Mike. Some of the early DE-1103/KA-1103s did not have protection diodes. Same with the Grundig G5/Eton E5 Later models of all radios had the diodes. My KA-1103 had the installed, my Grundig G5 did not. I added them to my G5. There is a PDF file on how I did it on the Eton E5 group in the files section. While the E5/G5 have a different display/memory unit, the radio board is the same.

There is a front-end FET that is famous for getting blown by static on these radios, especially those without protection diodes. There are documents in the files section of this group on replacing the front-end FET. The FET in question is a surface mount part, and is very small. Replacement of this part is not for the faint of heart! You will want to buy several, if you drop one, you will most likely not find it again.

I did replace one once. I needed a lighted magnifier, and I used #14 copper wire with a sharpened end, wrapped around the tip of a 30 watt soldering iron. Tweezers or a pair of hemostats are also necessary. I did manage it without disconnecting any wires between the 2 halves of the radio. You need to solder 1 leg of the FET and then let it cool down foe a few minutes.

I don't mean to put you off, but it is not an easy thing to get right, and you need to be experienced in soldering. I ordered 6 FETs, I have 2 left. I dropped 3, (never could find them, they are smaller than a common black ant!). These FETs are not expensive. The hardest part of the job is getting the FET in the correct position and holding it while soldering the first leg.

If you are able to replace the FET, adding the protection diodes is trivial, and highly recommended.

You should of course always disconnect any external antennas and collapse any whip antennas when the radio is not in use. Not touching the whip antenna during dry conditions (when there is most likely to be static from carpets etc...) is also a good idea. If you touch a metal object and get a shock, do so before touching the radio

Hi thank you for the info on that, yes I had a nasty idea it will have been the FET.
Ok so all I must do now is get one from some place, I wont do it myself as my hands are not so stable these days, but a friend of mine at the local Amateur Radio club has done SMC before, so it looks like he has got a jog to do lol.

Thank you.

Mike.

Hi Mike!
I have successfully used a TO92 package in place of the SMD package for the replacement of the front end transistor. I had to file the transistor just a bit as it is about five times bigger than the SOT transistor (SOT = Small Outline Transistor). I used the common MPF 102 FET available at Radio Shack.
Here is the title of the photos that can be seen in the photo section here on this group.... "Replacing Q1 with TO92 FET"

73 es good luck! Rod KB8DNS

From: Roberto
Topic: 3272 Message: 3272

Hi,
i've decided to change the if fileter on my degen 1103 on FM.
From schematics seem 2 for 10.7 mhz filter, but on component it's write 10.75 .
So, whath is the right frequency for filter in sobstitution?

Thanks
roberto iw2evk

The IF is the usual 10.70MHz. There are only 2 ceramic filters so you should use the narrowest filters you can get
Also you should cut out the old ones to avoid damage and loss of SMT components, which is likely to happen if you try to unsolder them

3274. Just Got C CRANE EP Classic Radio-Radio

Yahoo group: de1103
Date: 2013-04-05 00:40:20 UTC
From: Greg
Topic: 3274 Message: 3274

I know this is old news, C CRANE EP has been out for awhile, but thought I would post a review.

I owned a GE Superadio III which is a great MW/FM (mono only) radio. However they are out of production and the namesake or look alike versions new on the market are knock offs, not so good. I sold my Superadio III after I mastered aligning the AM, FM and Dial calibration. Superadio's are a bit tricky to align (well), (especially FM you need a sweep generator). The factory did a poor job of aligning some (not all) of them. Of course age takes a toll.

I don't have the SRIII to compare to the C CRANE EP, but I used my go-to bench mark radio a Degen DE1103. Apples and apples, using the internal antennas, the C Crane EP was as good or better than the Degen DE1103 on MW. The DE1103 has a much smaller internal ferrite internal loop stick for MW, but then it is a much smaller radio and a digital synthesized SW/AM/FM(St) radio. With an external antenna the DE1103 is of course amazing. The C CRANE EP has separate jacks for AM and FM antennas and a switch to go between external and internal.... Nice. I have not tried my 80' random wire on the CC EP yet. It might overload it.

I consider the DE1103 one of the best portable FM stereos I have heard (with headphones of course, both radios come with one built in speaker). The C CRANE EP was darn close, very nice FM stereo.

The accuracy of the EP's analog dial was as good as could be expected, very good. The fit, finish and quality looks excellent.... for the price a super deal. I paid $69.95 on Amazon with free shipping.

I don't have 'D' batteries, so I use AA's in 'D' cell adapters I got with my awesome LA Crosse Technology BC-9009 charger. I have not had the radio long enough, but my current battery endurance test is now at 7 hours and counting. I suspect I should get at least 10 hours (which I can count on with the DE1103). The rechargeable NiMh AA's.... assuming about 2000 mAHr capacity; fresh 'D' alkaline cells are 12,000-18,000 mAHr, about 6-9 times the capacity of the rechargeable NiMh AA's I have. I'd expect +60 hours, maybe 100 hours to be possible (depends on volume, using headphone, backlight) with fresh 'D' Bat's.

It comes with a wall-wart power supply. The backlight is very bright (GE SRIII did not have backlight of course). The original GE Superadio, SR II and SR III is are long in the tooth. If you are not a hardcore radio person, who can and/or wants to work on the radio, I would go with a new C Crane EP, in production, warranty and excellent performance.... The SRIII has a bigger speaker. The EP I think is a winner! Not news I realize but if you want a classic nonsense RADIO RADIO, the C CRANE EP is a no brainer.

3275. Re: Just Got C CRANE EP Classic Radio-Radio

From: Greg
Topic: 3274 Message: 3275

Battery test with AA's in 'D' cell adapters in CC-EP is done. It ran mostly on FM (which is a little more current draw than AM I believe) at moderate volume for 24 hours. The battery voltage was about 0.95 volts average. A DE1103 will only run down in the 1.22 volt cell voltage before shutting down.

I do not believe it has a low voltage shutdown. So if you leave it on and drain the batteries you can cause some issues that come from draining batteries to super low.

Topic: 3272 Message: 3277

Hi Julian,

i've make some test on narrow band fm signal on 78 mhz (italian police) .
The signal after changed the original 10,75 mhz marked filters with new 110 khz wide 10,7 mhz it's DECREASED.

I supposte mk3 version don't use 10,7 mhz but 10,75 khz i.f. frequency.The loss of sensitivity may be causated from "cutting" of signal off center frequency filters.

So i suggest use the same frequencies printed of case of original filter if want changed.

I'd send a message to tquchina on eBay. If anyone has replacements, it would be him.

Hi,

If anyone can send a capture of the 'ribbon cable' to me?

Regards,
- Tao Qu

3285. Static shock

Yahoo group: de1103
Date: 2013-06-05 19:50:39 UTC
From: Mike
Topic: 3285 Message: 3285

I have had my Degen DE-1103 for a while now, but I recently got a static shock, now the Degen is very poor indeed at picking up any thing, the FM side of it works ok, well it sound ok to me.
But the shortwave and SSB is very poor indeed to say the least.
From a Google search it looks like the front end transistor or mosfet?
Does any one know what the actual transistor is? And are they easy to get hold of?
Any help will be great. Soldering one in place is not a problem as I believe it is a small one.
And also is there a circuit diagram of this radio any where, IK tried Google but so far not much luck.
TIA,

Mike.

Sounds like the FET front end transistor Q1 has taken a hit, I replaced mine on a similar receiver, the E5 by Eton. I used a MPF-102 in place of the SMD FET. I had posted photos there of the job and the receiver came back to life in fine style. If you want I have a few FETs of the SMD size here that I could mail you.

In the files section, any folder can be opened and the files within downloaded. However the files in the root of the files section can not be accessed. You get an error saying the document can not be found.

3301. Small magnetic loop antennna for 200-500kHz (NDB)

Yahoo group: de1103
Date: 2013-07-07 09:45:49 UTC
From: krysatec
Topic: 3301 Message: 3301

Hi all,

here is very small (but good..) antenna which I use with my DE1103.
I use only "old electrics instalation boxes", cyanoacrylate and a few parts.

It is only 16x16cm but it is better than feritte antenna!

Capacitor is cca 720pF and coil have 40-42 turns by 27x litz wire.

Band is for Nondirectional beacons in EU: cca 200-500kHz now. But you can try also other coil!

Pictures here:

http://krysatec.benghi.org/phprs/images/201307070956_100_5721.jpg

http://krysatec.benghi.org/phprs/images/201307070956_100_5720.jpg

You can use it also with other radio!

Best regards, Jara "Rat, Czech republic, EU

I have also other antennas (longwire, miniwhip with 70cm "rod", bigger frame antenna..)

But my vesion of "small loop" is better than Degen ´s feritte antenna!

For instance:

stations at: 225/391/408/448kHz with LW antenna 30m long is signal 4/4/9/6

at with my very small antenna 9/0/6/4

I think that it is not bad...

Loop 35x35 cm had 9/6/9/9...

Al is better than only "feritte in DE1103"....

Best regards, Jara "Rat", Czechia, EU

3304. I have been messing around with a Kaito KA35 Active antenna with my KA-1103

I have been messing around with a Kaito KA-35 active antenna with my Kaito KA 1103. I have been getting some excellent Tropical band reception with it. And there has been someone on another board messing around with putting a tunable loop on the Kaito KA-35 for longwave but I could never get it to work. Has anyone else had an experience with the KA-35 Active antenna?

Boa Noite povo!!!
Alguém já tentou conectar a saída de som (aquela á direita embaixo
do receiver) a uma entrada de som de um PC com um programa SDR baixado
da internet?No manual diz que aquela saída é hibrida,pode ser da saída FI. de 455 kHz. Vou comprar um cabo P2P e experimentar.
Obrigado

Lino,
where did you find in the manual that the line
out jack is also an IF out?? I am reading the
DE-1103 manual, page 22, and the only thing I see
is that it is just a line out.

There was a discussion of using SDR software when using the BFO as a downconverter for DRM several months ago. I just uploaded some SDR software early this morning and the only use I found for the SDR software is for finding how off frequency a Radio Station I am listening to is. If this is supposed to do more with The Kaito KA1103 I did not find it.

Thank you Moissés for your reply!

I asked about that because there is a (not so) new model of Degen that has

an output for SDR and I think (or so) that the oldies could be conected

as SDR.

I do not have thecnical knowledge,I´m just curious about.

This is the translation of the message:

Hello friends.
Anyone know where I can find the IC Manufacturer NEC C1213C is an amplifier, or equivalent.
Anyone know where to download the schema radio Sony ICF 6500W. Already searched the Net
but're hard, my radio can only be silenced because this amp tunes to stations
see the display signal.
I appreciate any help.

The Gmail account I have will translate foreign language messages.

Now to answer the question:

The only places I know is in the US.

Try Mouser Electronics (http://www.mouser.com) or Digi-Key (http://www.digikey.com)for the semiconductor item. As for the Sony schematic there may be a group that may be able to help you.

Good luck

Hi All!

I have my DE1103 since 3 years.

Now, after 23 hours of charging, the battery indicator still blinks on and off.
Would the rechargable batteries have worn out?

Can I use just normal AA Alkaline batteries in it?

Thanks,
Bruno in Belgium

Why not simply replace the rechargeable batteries with a new set instead of spending money on disposable ones?

Rechargables are not satisfactory in the DE1103, because the desiners unfortunately set the drop-out voltage about 4.9V. Four new and fully-charged NiMH only give 5.0V so you only get about an hour of use from rechargables when they are in good condition
My suggestion is to shop around for a bulk-buy of reliable alkaline cells, and use them in a torch or something when they fail in the 1103

Oh, and take them out when not in use for more than a few days because the 1103 will drain the batteries for the clock and microprocessor

I wonder how long most users get from non-rechargables in the 1103?

Topic: 3312 Message: 3319

Thats strange as I'm still running mine on the original NiMh cells it came with a few years back.
I can still get well over an hour out of them but if I was aiming to use it for a longer continuous period I'd run it on the mains PSU anyway.

Even when I don't use it for several weeks at a time I've yet to find I have flat batteries on switch on and I never remove them as I like to have it to hand when the late night sleepless bug hits.

What I do ensure though is that I never leave it with half flat batteries or set to float charge for less than a 13 hour timed period and I never charge the batteries until the indicator is flashing.

And as I say, they still work.

To be truthful I'd rather keep charging my batteries than paying good money for alkaline cells which simply end up in landfill despite all government supposed good intentions with recycling.

It seems that different folks have different experiences with the Degen and its batteries

This is not true. NiMH batteries vary slightly in their full charge voltage. I get 1.4-1.44V on fully charged NiMH batteries. My Kaito KA1103 came with very poor quality batteries. With 2100Mah NiMh (Ray-o-vac 16X) batteries I get 25-28 hours of use before the radio shuts off. These radios were designed to use rechargeable NiMH batteries.

I have been using rechargables in my Grundig G5 for years. I get many hours of use after a recharge. I can't say how many hours, but I play the radio daily and it plays for weeks before the batteries need another recharge. I believe the G5 is all but identical with the 1103.

It's good to see that many users have good results with rechargables in these radios. If anyone can use a variable bench power supply to power a DE1103 or G5 I'd be interested to know the voltage below which the radio will not work

Topic: 3312 Message: 3325

I find the lowest battery voltage to be around 3.8 to 4.2 volts DC. At this point the receiver shuts down. "Dead" batteries at this level with not allow the rig to power up, I have to approach this voltage level from normal voltage.
In the opposite direction, the radio will not tolerate too high of a voltage but can handle just over 8 volts before the display goes wacko! I have not pushed this too far!

3326. noise when handling receiver

Yahoo group: de1103
Date: 2013-08-03 18:50:05 UTC
From: Roberto
Topic: 3326 Message: 3326

Hi at all,

when i use the degen with telescopic antenna i heard a noise changing if i handling receiver (i.e. hand near keyboard or right side during reception).
If i place the rx on standing support after many minutes the noise goes down.

I've place some sheld internally as suggested by Iris (radioscanner.ru), without results.

Some suggestions?

Thanks

Roberto iw2evk

Try to build a wooden cage with crossed rods . Then upholster this structure with common aluminum foil.
Place your radio in this structure and try to see what happen.
With this ancient technique I solved so many noises and lots of interference from anywhere.

Ho visto in giro consigli sul dengen dei più svariati; ma quello che impressiona è l'incompetenza e l'approssimazione di chi scrive.
Anni fa non era così.
Sul circuiti moderni e quasi posti a livello di schede madri per PC c'è poco da fare.
Una soluzione indolore, da valutare postazione per postazione, è la gabbia che ti ho proposto; a me funziona con i ricevitori di fascia bassa. Sul Drake R7 o sul Collins non si pone problema!
Buona fortuna !
Sandro

From: poikaa
Topic: 3326 Message: 3329

Your hand may be picking up the digital noise created by the display and causing a loop rebroadcast from your hand and body that your receiver will amplify.
This will vary from radio to radio and there is no real cure. It may be possible to add more shielding (screening) internally. possibly to add a ground wire.

That is true. Like many other portable radios (and even more expensive communications receivers) the internal CPU and mostly the display are not shielded very well. When touching the device your body picks up that noise and acts like a broadcasting antenna. In this case only an external antenna placed far away from the Degen (and your body) can help.
Henry

Hi Roberto. Just a thought, have you tried a different location in your home? A location outside your home? My thought is that maybe your body is picking up locally generated noise, and acts as an antenna when you touch the receiver, making the local noise worse.

Try using the radio in another room, and outside. Maybe even a block or 2 away or in a park. An outside antenna connected with coax might help, especially if you connect a ground to the coax shield.

Just a few thoughts on things you might try.

Hi all,

the most simple way i've found it's connect a 5 meters of exetranl wire antenna feeded via 9:1 un un .
The noise disapperas and the signals are strongs and clean.

Aanyway this is not the best solution for a "portagle radio".
The faraday cage from Sandro is intersted but not easy to manage...

From: richardlewis684
Topic: 3304 Message: 3336

Do not buy a MFJ 1020-c Active antenna for your Kaito/Degan KA-1103. Instead, go to http://www.kaitousa.com and buy a Kaito KA-35 Active antenna directly or you can pick one up at Universal Radio. I tried the KA-35 and the MFJ-1020c side by side with my KA-1103 and I found out that the MFJ-1020C does not pull in the Stations as well as the Kaito KA-35. When the MFJ-1020c hooked as an active antenna the MFJ 1020C will tune the stations in much weaker than the KA-35 will. This is one advantage I found. The signal strength is not adjustable on the KA-35. When hooked up to my antenna with the MFJ-1020c with the whip disconnected, the Kaito KA-1103 acted as if there was no tank circuit to peak the antenna. With all due respects to Larry Magne, this did not work as it was touted to be and it did not amplify the signal or peak the signal at all.

The conclusion I make is the Kaito KA-35 is much better for the KA-1103.

You may swear that you won't need it but where I was testing on the tropical bands the Kaito KA-35 would pull in a few more stations than just the whip which comes with the Kaito/Degan KA-1103. Also, if you are looking for a good AM amplified antenna, The Kaito KA-35 will work very well with the Kaito KA-1103.You can use the pickup coil that comes with the Kaito KA-35 or if you know a trick or two and tune below 100 Khz and tune up to the MW band(BCB)you can hook the antenna directly. (If you do not know the trick there is plenty of info in the files on this).

In conclusion, I will keep my Kaito KA-35 and return the MFJ-1020C to the retailer who sold me this on Ebay.

Remember that the MFJ most likely has a 50 ohm output. I don't know what impedance the 1103 antenna connector has but I've seen hints about 1 kOhm in this reflector. If this is the case, and the KA-35 has been built to match the 1103 I am not at all surprised.

I did a brief test this morning as I connected a Mini-Whip (outdoor active antenna, at 7 meters) to the 1103, and compared some signals in the 25-meter band. I was rather surprised to learn that the signal level was actually better with the 1103's own whip than with the outdoor antenna. The outdoor antenna connected to my NetSDR of course provided far better reception. This could indicate that there is an impedance mismatch leading to a considerable attenuation of the signals.

Hi Bjarne & everyone

I haven't never used my 1103 to do DX in shortwave. Just a weeks ago I replaced fm wide filters by two fm narrow filters (110 & 80 khz) in order to check it in FM DX. Selectivity improved a lot, and it looks an absolutely different radio.

I have a large experience in shortwave DX with great receivers, but I haven't never checked my 1103 because I thought It might suffer any damage if I connect it to my active loop wellbrok antenna. I read that you are using an active antenna with your receiver. So, can't a strong signal damage the 1st stage of the receiver?

Hi all looking through my bits and bobs box, I found a good working MPF102, I will replace the damaged front end Transistor on my Degen DE-1103.
But I need to know what way round do I put it in, I can not afford to make a mistake as this is the only transistor that I have for the job.

TIA,

Mike.

I have both the Degen 1103 and the Grundig G5. It is my understanding that the external antenna input for the G5 is low impedance (50-75 ohms); this is stated in the manual of the Grundig G5/Eton E5. I am wondering if this isn't true of the Degen as well, since the Grundig/Eton is in most respects a clone of the Degen. Though I have a Degen 1103, I haven't actually done a side by side comparison to determine whether it behaves exactly like the Grundig G5.

Subject: Re: [de1103] Re: I have been messing around with a Kaito KA35 Active antenna with my KA-1103

Remember that the MFJ most likely has a 50 ohm output. I don't know what impedance the 1103 antenna connector has but I've seen hints about 1 kOhm in this reflector. If this is the case, and the KA-35 has been built to match the 1103 I am not at all surprised.

I did a brief test this morning as I connected a Mini-Whip (outdoor active antenna, at 7 meters) to the 1103, and compared some signals in the 25-meter band. I was rather surprised to learn that the signal level was actually better with the 1103's own whip than with the outdoor antenna. The outdoor antenna connected to my NetSDR of course provided far better reception. This could indicate that there is an impedance mismatch leading to a considerable attenuation of the signals.

>Do not buy a MFJ 1020-c Active antenna for your Kaito/Degan KA-1103. Instead, go to http://www.kaitousa.com and buy a Kaito KA-35 Active antenna directly or you can pick one up at Universal Radio. I tried the KA-35 and the MFJ-1020c side by side with my KA-1103 and I found out that the MFJ-1020C does not pull in the Stations as well as the Kaito KA-35. When the MFJ-1020c hooked as an active antenna the MFJ 1020C will tune the stations in much weaker than the KA-35 will. This is one advantage I found. The signal strength is not adjustable on the KA-35. When hooked up to my antenna with the MFJ-1020c with the whip disconnected, the Kaito KA-1103 acted as if there was no tank circuit to peak the antenna. With all due respects to Larry Magne, this did not work as it was touted to be and it did not amplify the signal or peak the signal at all.

My KA-35 nearly approximates my whip on Short Wave if not a little better. The station I pulled in last night on the Tropical Band was from South Africa and was coming in faintly from Forest, MS, USA and the KA-35 it comes in just a little bit more. The KA-1103 and the Degan DE-1103 and the Grundig G5 are the same board RF wise. The FET front end makes the Kaito KA-1103 hot. You can interchange the KA-35 with the KA-1103 with the whip up on Short Wave and on some bands you could not tell the difference. What is different is on AM you can practically pull some local signals out of the dust with the KA 35 pickup coil and the amplified loop feature of the Kaito-KA35 near the built-in ferrite loop which comes in with the Kaito KA-1103. I know of one oldies station in Jackson, MS USA that is faint or doesn't come in very well from 40 miles away and the pickup coil plugged into the KA-35 comes in like a regular local. And yes the radio has a 50 ohms input.

From: Roberto
Topic: 3345 Message: 3345

Hi at all,
during working for repair antenna , i've damaged the ribbon cable for connect the 2 half of radio.
Someone know were buy a similira flat cable (if possible more long!)
Or , someone have tried to connect the 2 bouard using multiple wires recovered from i.e. network cable like this :

http://www.radioscanner.ru/forum/topic13752-157.html

Thanks

3346. Solar charger cable

Yahoo group: de1103
Date: 2013-08-29 17:01:21 UTC
From: Martin
Topic: 3346 Message: 3346

Hi Folks. I just got a solar charger. This charger basically has solar cells that charge its internal 2600Mah Li-Ion battery. When charged, the unit can be used to run or charge various devices. The charger has outputs of 4.5v, 5.5v, 6.5v, and 9v. Therefore with an appropriate cable it should be able to run (maybe charge the batteries too) in my Grundig G5, and Kaito KA1103. Has anyone tried this before? The cable needed is micro-USB to the correct coaxial plug for the radios. Does anyone know of a cable that will work? Or has anyone made a cable? Does anyone know what size coaxial connector fits these radios?

Thanks.

BTW this charger is available on eBay for $13.99 shipped.

>
> What is the size of the DC power connector, the barrel and the pin, on the Degen 1103?
>

Outer diameter of the plug connector = 4 mm. / / The central hole accepts a pin of 1.5 mm.
Plug length =10 mm
These are measures of the external male connector, not the female socket of Degen! Ok?

Best 73 ! Stefano.

3349. Power supply cut-off threshold issue and other...

Yahoo group: de1103
Date: 2013-09-25 19:37:38 UTC
From: Luigi Candurro
Topic: 3349 Message: 3349

Hi all,
I bought the DE1103 a week ago, it's a pretty good receiver but there are some issues, two of which I would like to fix.

The first is related to the "blip blip" noise when moving the jog for tuning, expecially in some bands. I found the description of a fix, which requires two additional 15nF capacitors to be mounted.

The second is the too high power supply cut-off threshold, which prevent from using the full charge of rechargeable batteries. I have measured this threshold on my receiver, the power supply cut-off occurs below 4.79 V, but a voltage greater than 4.90 V is needed in order to turn the Degen on again.

I couldn't find an already tested fix for this issue, so I decided to study the schematic in order to find a solution. The supply voltage (VDD) is checked at two points:

1. pin 8 of IC10 (46R47), an analog input of the micro controller, fed by a voltage divider made of two 470kOhm resistors
2. pin 19 of IC8 (S3P72N4), fed by the output of the ZS2 (7039) voltage detector, whose output goes low if the VDD falls below 3.9 V.

The 3.9 V threshold is very different from 4.78 V, so I don't think the cut-off threshold has something to do with IC8.

If the cut-off is driven according to the voltage read at pin 8 of IC10, a 4.78V voltage at VDD corresponds to a 2.39V at the pin 8. Let's assume this is the voltage threshold stored in the IC10 firmware. In order to move the cut-off voltage from 4.78V to i.e. 4.0V, we should change the voltage divider ratio: 4.0/(1+R846/R847) = 2.39, so R846/R847 = 0.67364. If we let R847 = 470kOhm, then R846 = 316.6kOhm, which can be approximately obtained connecting an additional 1MOhm resistor in parallel to R846. We should obtain a new cut-off threshold of 4.02V.

Is a such voltage compatible with the Degen circuitry?
IC8 and IC10 are powered by a 3.0 V voltage, obtained from VDD by means of a LDO regulator (ZS3, 7530), whose min input operating voltage is 4.0 V. Other min supply requirements are: 4.0 V (ZS1, 7530 feeding IC4), 1.6 V (IC1, TA7358) , 3.5 V (IC2, TA2057N), 1.8/3.0 V (IC5, CXA1622P), 3V (IC3, LM358AM). Therefore the supply voltage requirement to be fulfilled is 4.0 V. This should be compatible with the new cut-off threshold of 4.02V, which can be considered as the series of four 1.005V batteries, which corresponds to almost-drained NiMH quality batteries.

Has anyone already experimented something similar?

Regards

Luigi

Hi Jules,
Surfing on the Net I have read of 4V cut off threshold, too. Maybe they are older versions of the receiver.
I have checked mine, it has the input FET stage protection diodes, a modification typical of the receiver new version.
I am happy you are interested in the cut off threshold modification; it will be interesting to compare our experiences.

I couldn't find an already tested fix for this issue, so I decided to study the schematic in order to find a solution. The supply voltage (VDD) is checked at two points:
pin 8 of IC10 (46R47), an analog input of the micro controller, fed by a voltage divider made of two 470kOhm resistors
pin 19 of IC8 (S3P72N4), fed by the output of the ZS2 (7039) voltage detector, whose output goes low if the VDD falls below 3.9 V.
The 3.9 V threshold is very different from 4.78 V, so I don't think the cut-off threshold has something to do with IC8.
If the cut-off is driven according to the voltage read at pin 8 of IC10, a 4.78V voltage at VDD corresponds to a 2.39V at the pin 8. Let's assume this is the voltage threshold stored in the IC10 firmware. In order to move the cut-off voltage from 4.78V to i.e. 4.0V, we should change the voltage divider ratio: 4.0/(1+R846/R847) = 2.39, so R846/R847 = 0.67364.
If we let R847 = 470kOhm, then R846 = 316.6kOhm, which can be approximately obtained connecting an additional 1MOhm resistor in parallel to R846. We should obtain a new cut-off threshold of 4.02V.
Is a such voltage compatible with the Degen circuitry?
IC8 and IC10 are powered by a 3.0 V voltage, obtained from VDD by means of a LDO regulator (ZS3, 7530), whose min input operating voltage is 4.0 V.
Other min supply requirements are: 4.0 V (ZS1, 7530 feeding IC4), 1.6 V (IC1, TA7358) , 3.5 V (IC2, TA2057N), 1.8/3.0 V (IC5, CXA1622P), 3V (IC3, LM358AM). Therefore the supply voltage requirement to be fulfilled is 4.0 V. This should be compatible with the new cut-off threshold of 4.02V, which can be considered as the series of four 1.005V batteries, which corresponds to almost-drained NiMH quality batteries.
Has anyone already experimented something similar?
Regards
Luigi

If you use Firefox, there's a plugin that allows you to use the old format.

http://uk.groups.yahoo.com/group/ModerationPlugin/
<http://uk.groups.yahoo.com/group/ModerationPlugin/>

One thing I really hate about the new format is that pictures are now displayed through Javascript, which makes it much more difficult to save them for reference.

As the test results say, the cut-off voltage threshold is too high for NiMH batteries.
When the cut-off function occurs, the batteries still have much energy stored.
I'm trying to modify the voltage monitoring circuit, in order to lower the cut-off threshold to a more convenient value, 4V, compliant with the supply min requirements of the I.C. used in the receiver.

Hi Guys. I have never tested the batteries my KA1103 or my G5 shut down, but with 2100Mah low self discharge batteries, both radios run 24-28 hours (over a week or so) before the radios shut down. The test results below show that the battery voltage should be 1.195 per cell when the radio shuts down. 1.225v per cell is required for the radio will turn on. This is of course if the battery voltages on all 4 batteries are the same.

My NiMH batteries used for the above radios all test at 1.44v when fully charged (in the radio). I do not know if the shut-down voltage of my radios matched that of your radio. I hope that you realize that making the shut-down voltage too low could damage parts in your radio.

Hi Martin,
the voltage values you have referred to give, if multiplied by 4,
exactly the threshold voltage values of 4.78 V and 4.90 V I have
measured in my receiver test. I think our receivers have the same
cut-off and turn-on voltage thresholds.

> I hope that you realize that making
> the shut-down voltage too low could damage parts in your radio.

I have cross-checked the new expected threshold voltage, 4V, with the
I.C. data-sheets; it should be compatible with the I.C. minimum power
requirements. These component are the most susceptible to under-voltage
problems, expecially the two microprocessors and the EEPROM.
Nevertheless they are fed by a 3.0V LDO voltage regulator, which can
operate correctly even with 4V at its input. I'm optimist about the
possibility that the receiver may operate safely even with a 4 or 4.1V
supply.

Hi Luigi. Apparently I was not clear. I have not measured the voltages of my batteries after the radio shuts down. The values I gave were calculated from the voltages you gave, and were just for reference. I have never tried to determine the voltage at which my radios shut down.

Have you kept track f the time the batteries last from full charge to shut down? It is easy. Just write down the times and dates when you turn the radio on and off. Then you can add up the times and get the number of hours your radio will run on a set of batteries.

Hi Martin,

I didn't keep track of the time you refer to; however I checked the
1300mAh batteries as soon as the cut-off occur: they are all 1.24V.
In my opinion, NiMH batteries at 1.24 V are far to be considered drained.
Indeed battery analysers usually take 0.9V as the discharge cut-off
voltage for NiMH batteries.
I think the operating time is important, but it is more important that
batteries charge is effectively used by the receiver. Unfortunately this
does not happen, now.

I implemented the change I have explained before in this thread;
unfortunately only the battery charge indicator is affected.
The cut-off voltage and the turn-on-from-cut-off voltage are almost
unchanged: 4,80V and 4,91V.
There is something missing...

3361. DC jack fault and battery cut-off threshold issue: SOLVED

Yahoo group: de1103
Date: 2013-09-29 16:35:46 UTC
From: Luigi Candurro
Topic: 3352 Message: 3361

If the exclusion contact of the J2 DC jack connector remains open because of a fault, the receiver current flows in the following way: battery+, receiver circuit, ground path, 2D3 diode, battery-. The diode 2D3 has not been reported in the schematic, it may be a recent upgrade. This diode is connected between the battery negative terminal (cathode) and the ground (anode).

If the receiver is on, the diode add a voltage dropout of 0.8 - 0.9 V, which makes the CPU section see a lower battery voltage, and the voltage monitor raise the shut-down condition when the batteries have already energy to give.

I have tested the Degen 1300 mAh NiMH batteries, sold with the DE1103 receiver, with the Maha-Powerex MH-C9000 analyzer and the break-in program, which is compliant to IEC standards.
All the four batteries show an actual capacity of 1000 - 1020 mAh, well below the 1300 mAh declared.

Topic: 3364 Message: 3364

Hello

My old batteries were exhausted and I bought a new 4 Ni-MH 2700 mA set. After changing the batteries the receiver was deaf in all bands, MW, SW and FM. I can not hear anything. Volume control works and I can hear a background hiss. The hiss is the same for all modes, FM, MW and SW. SSB button does not work.

I have pressed the RESET buttons several times and still does not work.
I have left the receiver without batteries for 5 hours with no luck.

Thanks.
Ramiro. EA4NZ.

Hi

Have you already tried another battery package or the AC adapter?

Thanks.
Batteries are full charged I have checked them with my voltmeter.

The same thing happened with my degen 1103.
I removed the battery and left 24 without them.
The next day the radio resumed normal life.
Already running normal over a year.
Try this.

It's a common issue with the DE1103 that happens this way. I second the suggestion to let it drain the voltage kept by the caps.

Thank you very much.

I will wait for several hours with the batteries removed. I would like to know which capacitor sould be discharged manually to spead up the process. :-)

Thanks

Hello everyone,

I also had a problem similar with my DE1103 .. I left it with no batteries for 1 or 2 days .. and when I put new batteries in it .. it came back to life.

It seems to be sensitive to battery changes

Like a few other reply's, I've only have the batteries out of my 1103 a few times (I use rechargeables) .. but each time I had to do the reset to bring the radio back to life. I don't recall being patient enogh to just wait an extended time with the batteries out. So I try to not take the batteries out!

Good luck!

I'm trying to figure out if the last release of the receiver, which shows some HW changes with respect to the previous releases, has been improved about the battery change issue. I bought the receiver last month, and I have removed and replaced batteries (rechargeable type) several times till now, but I had to use the reset button just 2 or 3 times. No wait for capacitor discharge.
Till now... ;-)

Interesting. I bought mine 2 years ago.

This loooong waiting procedure is horrible. Each time you fail you must
start again. If you are not patient enough it is a nightmare.
The problem is that I do not know if I must wait for 1 day or 5! :-)

I do not know if my dear receiver has died for ever.

73, Ramiro.

Hi. I would try a reset several times both with and without the batteries. And if it does start working, plug it in with the wall wart when changing batteries! I use NiMH batteries and charge them in the radio.

A friend had a G5 that worked fine. He was taking the batteries out and charging them without plugging the wall wart into the radio first. He is blind, so can't see to charge batteries in the radio. After one battery charge, when he put the batteries in, the radio would work on SW, but not on FM. No matter what we tried, the radio got progressively worse. Now it might or might not start working after being on for 10-15 minutes. It lights but no frequency display, and no audio, not even a slight hiss. It is now in a closet here as a parts radio as the case, antenna, etc are good.

I believe that this could have been avoided if he had plugged in the radio before taking out the batteries, and left it plugged in until the batteries were charged and back in the radio. Some of the Kaito/Degen 1103 and E5/G5 radios seem to be sensitive to some sort of power surge when batteries are removed and new or freshly charged batteries are inserted.

I also did all sort of reset combinations, with batteries, without batteries, with the AC charger, without it...

I will try again on the week end. My degen is resting now without batteries....

3381. Back to back diods

Yahoo group: de1103

Hi all,
Just had this idea.....

I have 4 short wave rados i use with a Zetagi 4 way switch box. Ok it works and all that, but the idea is this.
Antenna IN to a block of back to back diods each set going to a radio of there own.

What type of diods what you think would be the best for this?

Mike M6YMN

What do you expect the diodes to do? If you expect to run all the radios at the same time and isolate one from the other with the diodes - sorry, won't work. You need a splitter.

Cheers - Martin ZL2MC

Topic: 3381 Message: 3383

I assume you mean to place the back to back diodes in series with the antenna input connector of each receiver with the antenna itself going to a common connection with each pair of diodes.
You won’t receive anything as the forward voltage drop of the diodes will be a minimum of 200 to 300mV depending on the diode type. So you will need a very strong signal to overcome the forward voltage drop. In other words, it won’t work!
If you do have enough signal level to overcome the forward voltage drop then due to the non linearity of the diodes you will also finish up with very high intermod levels.
Passive splitters will work but of course tou will have loss in the splitter, depending how many ports. A 4 port splitter will have a little more than 6dB loss per port and you need to find splitters with the appropriate frequency coverage.
Grant, ZL2BK

Subject: [de1103] Back to back diods [1 Attachment]

[Attachment(s) from mikem6ymn@gmail.com included below]

Hi all,
Just had this idea.....

I have 4 short wave rados i use with a Zetagi 4 way switch box. Ok it works and all that, but the idea is this.
Antenna IN to a block of back to back diods each set going to a radio of there own.

What type of diods what you think would be the best for this?

Mike M6YMN

Yes I see I had the circuit all wrong any way.
But also I get what you mean.

Back to the drawing board as they say.

Mike.

Still won't work. Diodes need to have 0.3volts applied to the anode before they conduct.
You need a splitter.

http://www.dxing.info/equipment/rolling_your_own_bryant.dx

Cheers - Martin

Hi Martin, yes I agree with you, I had the circuit all wrong to start of with.
But what sort of splitter would you recommend?
Resistors perhaps?

Mike.

Hello!

I left my Degen 1103 for 5 days without batteries. It did not work. I was about leaving it for 1 month resting period. I could not wait....

Tired of blind testing, I opened the receiver. Removed the dial cables, the ribon cable and desoldered the speaker cable. Removed the microprocessor board shield.

I measured some voltage at some main microprocessor pin. Something like 200 mV. I shorted to GND every microprocesor pin. I shorted to GND everything I was able to.

I also shorted to GND some pins of the TA2057 in the analog board (probably of no interest).

I assembled the receiver again.

The receiver has come to life again!

You can see pictures at:

So this confirms this is a problem that appears when some amount of current keeps inside the circuit and around the microprocessor. Congratulations for the decision of putting hands inside the plastic shell!

There are some similar weird "tin balls" on the micro board, but I don't
think they are the cause of the malfunction.
Unless one or more of them are bad solder joints, and are related to
capacitor discharge...

Yes, I attached the picture for you just to see the quality of the soldering.

I cross my fingers, hope my dear and beloved receiver will work for years.

Many thanks to all

Yes, voltages inside the processor seem hard to remove by itself. It is
better with some external help! :-)

Hello Ramiro,
Mine DE1103 worked perfectly from the first day (purchased on 2005 from eBay NIB) until now - pure luck .
Here you can see some mods :
https://sites.google.com/site/4z5nu4z5nu/
https://37aa5161-a-62cb3a1a-s-sites.googlegroups.com/site/4z5nu4z5nu/index/DE1103displaymod.jpg?attachauth=ANoY7co6YGpBHHktZLler_RD6rGn32p0Oz0faXeimBk3rqzTKXcD2L7cxj1OFr-vkXTq0gF2IRvwkwQNSIVMsXas814DmENO-MxdMCv9tDiPUCEzAMviFoqSfH4hfT54vcAwY4taUvOCONkneFuRCB8TTUQfaDOhFEEwpGl1WffZzHjTqBLXd6ibR5_LqAo8oGpCbOPKCVPp_cDuF7PqVFb5ShUy6kNynIhQNKt8Kg2irfpHRJTQmXs%3D&attredirects=0

Hello!

I left my Degen 1103 for 5 days without batteries. It did not work. I was about leaving it for 1 month resting period. I could not wait....

Tired of blind testing, I opened the receiver. Removed the dial cables, the ribon cable and desoldered the speaker cable. Removed the microprocessor board shield.

I measured some voltage at some main microprocessor pin. Something like 200 mV. I shorted to GND every microprocesor pin. I shorted to GND everything I was able to.

I also shorted to GND some pins of the TA2057 in the analog board (probably of no interest).

I assembled the receiver again.

The receiver has come to life again!

The horizontal "crack" looks like a drop of glue used to fasten the quartz to the PCB.

I see the vertical scratch, it crosses all the micro layout of the board.

Oh, no, sorry for the picture. It is a photo illusion. It is actually a drop of glue. The light refraction on the edge of the drop causes a false illusion that the board is broken, but is not. I think...

Thanks.

Topic: 3394 Message: 3398

Hi.

Both the large horizontal ‘crack’ and the vertical ‘scratch’ on the pcb are simply glue deposits.
I looked at the image with an enhancement package and you can clearly see the vertical refraction of the track caused by the glue going across the track beneath.

Overall though the QA on the post-production of the pcb is abysmal!

Slim H

That would be a good thing, to find a longer ribon cable in order to be able to play with the receiver with the two halfs opened.

multiple cables seem to be harder to do, but possible with some patience.
;-)

Sorry for the false start, Ramiro, but it quite an optical illusion. Given what I've found in some of their radios, it wouldn't have surprised me.

Nelson

---In de1103@yahoogroups.com, <ea1abz@...> wrote:

Oh, no, sorry for the picture. It is a photo illusion. It is actually a drop of glue. The light refraction on the edge of the drop causes a false illusion that the board is broken, but is not. I think...
Thanks.

Ramiro,

Excellent detective work. I'll try this on my G5 or G3 if they ever become unresponsive.

Btw, did you notice the horizontal crack in the processor board just above the crystal in picture 3? It nearly cuts through the ground foil.

http://ea4nz.ure.es/degen/degen-03.jpg http://ea4nz.ure.es/degen/degen-03.jpg

There's a vertical scratch where it looks like it took a hit. Great QC at Degen.

Nelson

---In de1103@yahoogroups.com mailto:de1103@yahoogroups.com, <ea1abz@...> wrote:

Hello!

I left my Degen 1103 for 5 days without batteries. It did not work. I
was about leaving it for 1 month resting period. I could not wait....

Tired of blind testing, I opened the receiver. Removed the dial cables,
the ribon cable and desoldered the speaker cable. Removed the
microprocessor board shield.

I measured some voltage at some main microprocessor pin. Something like
200 mV. I shorted to GND every microprocesor pin. I shorted to GND
everything I was able to.

I also shorted to GND some pins of the TA2057 in the analog board
(probably of no interest).

I assembled the receiver again.

The receiver has come to life again!

3402. RE: Degen 1103 strangely dead after changing to new batteries

Yahoo group: de1103
Date: 2013-11-01 21:36:29 UTC
From: <kb8dns@...>
Topic: 3364 Message: 3402

Nice photos and nice fix for the "lock up" fault!

Looking at the photos I see the same over burden of solder flux and dust as there is with my Degen and Gundig G3, kind of a sloppy way to treat a radio and points to cheap assembly and poor quality control.
I am wondering if the stuff was cleaned up, there would be no "crosstalk" with the CPU signals?

Sorry for the false start, Ramiro, but it quite an optical illusion. Given what I've found in some of their radios, it wouldn't have surprised me.

Ramiro,

Excellent detective work. I'll try this on my G5 or G3 if they ever become unresponsive.

Btw, did you notice the horizontal crack in the processor board just above the crystal in picture 3? It nearly cuts through the ground foil.

http://ea4nz.ure.es/degen/degen-03.jpg http://ea4nz.ure.es/degen/degen-03.jpg

There's a vertical scratch where it looks like it took a hit. Great QC at Degen.

Nelson

Hello!

I left my Degen 1103 for 5 days without batteries. It did not work. I
was about leaving it for 1 month resting period. I could not wait....

Tired of blind testing, I opened the receiver. Removed the dial cables,
the ribon cable and desoldered the speaker cable. Removed the
microprocessor board shield.

I measured some voltage at some main microprocessor pin. Something like
200 mV. I shorted to GND every microprocesor pin. I shorted to GND
everything I was able to.

I also shorted to GND some pins of the TA2057 in the analog board
(probably of no interest).

I assembled the receiver again.

The receiver has come to life again!

I would consider of benefit for users to put a How-to, guided tour re. the problem and fix for this issue... Maybe the author would like to write something describing this common problem, or maybe it's just enough to find the message/thread... I don't now... take it as a suggestion.

3404. Degen DE1103: LW band sensitivity

Yahoo group: de1103
Date: 2013-11-02 09:41:45 UTC
From: Luigi Candurro
Topic: 3404 Message: 3404

Hi all,

I've done a comparison test between the Degen and another low cost receiver, bought at a Lidl store.

The test was simple and qualitative, I haven't the proper instrumentation to perform quantitative tests.

In the MW band the DE1103 is more sensitive and selective than the Lidl receiver. The number of broadcast stations received and their signal quality is better with the Degen.

In the LW band I got opposite results: the few stations received had cleaner signal with the Lidl receiver.

All tests have been performed with the internal receiver antenna.

I suspect a low sensitivity of the Degen receiver at lower frequencies, lower than 500 kHz.

Has anyone done similar tests?

Regards

Luigi

Ciao Imo, scrivo in Inglese cos? ci capiscono tutti.

Hi Imo,

unfortunately I can receive only two o three stations in LW where I
live, and all very faint. I live in downtown, so much EM noise prevent
me from having a better radio receptions in AM, expecially in LW and MW.

I will try in a better place as soon as I can.

Luigi

Sono convinto che il Degen non abbia problemi nelle LW. Ricevo bene con l'antenna in ferrite ma meglio con lo stilo con la modifica sotto i 100 khz che abilita lo stilo.
Sento il radiofaro a 75 khz.
Certo se la tua posizione ti dà problemi prova a cambiare posto.

A meno che l'esemplare in mio possesso non abbia particolari problemi, ho visto da misure condotte da altri che la sensibilità in ingresso verso i 100-200 kHz è solo di poco inferiore a quella nelle OC.

Ho provato con la modifica a cui ti riferisci e con l'antenna filare da 10 m in dotazione, verso i 75-76 kHz in SSB percepisco qualcosa di periodico ma molto debole.
Con la stessa modifica in LW e MW ricevo praticamente solo disturbi.

Grazie per il riscontro

Luigi

A meno che l'esemplare in mio possesso non abbia particolari problemi, ho visto da misure condotte da altri che la sensibilità in ingresso verso i 100-200 kHz è solo di poco inferiore a quella nelle OC.

Ho provato con la modifica a cui ti riferisci e con l'antenna filare da 10 m in dotazione, verso i 75-76 kHz in SSB percepisco qualcosa di periodico ma molto debole.
Con la stessa modifica in LW e MW ricevo praticamente solo disturbi.

Grazie per il riscontro

Luigi

Ciao Imo, scrivo in Inglese così ci capiscono tutti.

Hi Imo,

unfortunately I can receive only two o three stations in LW where I live, and all very faint. I live in downtown, so much EM noise prevent me from having a better radio receptions in AM, expecially in LW and MW.

I will try in a better place as soon as I can.

Subject: [de1103] Degen DE1103: LW band sensitivity

Hi all,

I've done a comparison test between the Degen and another low cost receiver, bought at a Lidl store.

The test was simple and qualitative, I haven't the proper instrumentation to perform quantitative tests.

In the MW band the DE1103 is more sensitive and selective than the Lidl receiver. The number of broadcast stations received and their signal quality is better with the Degen.

In the LW band I got opposite results: the few stations received had cleaner signal with the Lidl receiver.

All tests have been performed with the internal receiver antenna.

I suspect a low sensitivity of the Degen receiver at lower frequencies, lower than 500 kHz.

Has anyone done similar tests?

Regards

Luigi

Già fatto, in LW mi sembra meno sensibile.
Probabilmente è il mio luogo di residenza che è particolarmente disturbato, devo fare la controprova magari in campagna, lontano da disturbi EM di forte intensità.
In una grande città ormai tra linee elettriche, motori elettrici e a combustione interna (con accensione elettrica), dispositivi vari a radiofrequenza, computer, apparecchiature elettroniche praticamente quasi tutte basate su microprocessori, è difficile ascoltare in LW e MW, ma anche in SW, senza disturbi anche molto intensi.

That's an interesting question. Do you know of anything that will safely remove the flux and residue?

The QC issues go beyond dirty PC boards and poor solder joints, tho. One of the G5's I tried at Radio Shack about 5 years ago had broken ferrite antenna wires hanging out from between the case halves, and I later discovered the one I kept had one lead pulled out of the filter capacitor on the DC input. I replaced the cap, of course, but geez.

Looking at the photos I see the same over burden of solder flux and dust as there is with my Degen and Gundig G3, kind of a sloppy way to treat a radio and points to cheap assembly and poor quality control.
I am wondering if the stuff was cleaned up, there would be no "crosstalk" with the CPU signals?

Ho fatto una prima prova all'aperto su LW e MW e va molto meglio, sia
con l'antenna interna (ferrite) che con quella a stilo, attivando la
modalità sotto i 100 kHz.

All Chinese radios I have (including the DE1103) have poor sensitivity on the LW band. They don't care much about good performance in a band which is used only in a few countries, most of them in Europe.

The best LW radios I have are the Sony's (2010 and 7600GR), the Eton E1, and a couple of older radios made in the USSR and Poland (Selena, Unitra).

Regards,
Tudor

Thanks, Tudor. This confirms my suspicions.

However I did a test yesterday, reception in open air. Although I was not in a clean EM environment, the results have been much better, even in LW.

I use a 70% or 90% rubbing alcohol to remove the flux.... The flux if left on the board can cause corrosion and introduce moisture along with dust and maybe life forms.

Thanks. I would like to test the "repair procedure" in another receiver
to see if if works. At least it worked here. My Degen is working fine !

3425. Charging batteries not working.

Yahoo group: de1103
Date: 2013-12-14 07:17:50 UTC
From: Pete
Topic: 3425 Message: 3425

For over a year i have used a set of 4 no-name brand 2300mAh NiMH cells and my KA1103 happily allowed me recharge them (switch off, hold VOL and turn tuning/vol knob to set the charge time to 23hrs.

Recently the batteries just would not charge so i assumed they were faulty after so many recharges and bought some new Sanyo "eneloop" NiMH 1900mAh. These are supplied fully charged and it has taken quite a few hours to discharge them enough to the point the KA1103 keeps switching off maning they must be recharged.

Problem is that if i power off the KA1103, plug in power adapter, press and hold VOL and turn the Tuning/Vol knob no longer is the count for number of charge hours shown. The radio is dumb. Even if i try pressing the number buttons and then the VOL button no charging starts...

I have tried RESET, set the TIME and still no charging is possible.

Has anyone seen this happen too and is there a fix? Any help appreciated.

Series charging, time-controlled and at a very low rate is the worst way
to charge NiMH batteries.
It can easily cause battery charge unbalance, undercharging or
overcharging condition.
Much better to charge batteries with a good external charger.

> Recently the batteries just would not charge so i assumed they were

If you fill a set of fully charged batteries in the receiver, does it
work properly?

Thanks for the replies folks....

Agreed, i should charge in a proper charger unit but it's just so much more convenient in the KA1103's "downtime" to have it do it's magic and do the charging process.

The brandnew out of the packet eneloop cells gave me a whole week of rough-guess 10hrs duration run at low volume on FM before the receiver started to do it's auto-switch off and flash the battery symbol.

I have since loaded some standard non-rechargeable alkalines and the radio is working fine at switch-on as a receiver. The same if i plug in the adapter.

Now with my discharged eneloop NiMH cells installed the KA1103 shows the discharged state on it's bar graph and the battery symbol.

Maybe the charging section on my KA1103 is broken...

3429. RE: R: Re: [de1103] Degen DE1103: LW band sensitivity

Yahoo group: de1103
Date: 2013-12-27 03:12:16 UTC
From: <llanberg@...>
Topic: 3409 Message: 3429

Glad to see some others enjoy longwave. When I found out that the KA1103 can tune down to 0 kHz and it's small internal loopstick is disconnected, I ordered one. Which I'm currently waiting on. (And I joined this group). Anyway, more on topic: the $79 Radio Shack 20-629 (a reissue of the former DX-402, a.k.a. Sangean ATS-505) is pretty good on longwave. At least compared to other portables. I can get several beacons just by turning the radio on and tuning in. No inductive coupling. But the drawback is it's the LW band is restricted to 153 kHz- 279 kHz.

Also, like the KA1103 the good old Radio Shack DX-394 can be tricked into tuning down to 0 kHz. In fact that was the first radio I received the 60 kHz WWVB time signal on.

Happy New Year, all.

Larry

Hi Larry,

did you receive the time signal with the receiver internal antenna or an
external one?
What kind of antenna did you use? Loop?

3431. FM band off frequency

Yahoo group: de1103
Date: 2013-12-28 19:52:53 UTC
From: <grant@...>
Topic: 3431 Message: 3431

My receiver appears to be off frequency on the FM band. I need to set the displayed frequency 1 or 2 steps lower then the actual frequency for best results. If wanting to receive 100MHz for example, the received audio is best when set to 99.5MHz or 99.7MHz. Is there an adjustment to correct this? Could be the synthesizer frequency reference or maybe the FM detector tuning.

On the DX-394? I used a small homemade loopstick and ran it into a small LF preampflier, then into the antenna jack. I just got my KA1103 today. I'm about to do the same thing on it.

Are the loopstick and the LF preamplifier commercial or homemade? In the
last case, is the design documentation public domain?

Hi Luigi, first: I see what you mean about the KA1103 being deaf on longwave. You weren't exaggerating.

Loopsticks I wind my own, and very simply. No Litz wire or anything fancy. I have huge ferrite rods that I bought from here (see section "Monster Rods"): www.stormwise.com http://www.stormwise.com

On that same website, once you look hard enough, you'll find schematics for simple, single-transistor LF preamplifiers. I build mine on plug-in protoype boards, no soldering. However, if you want a high quality LF preamplifier, a place called LF Engineering sells those: https://www.lfengineering.com/products.cfm#Components https://www.lfengineering.com/products.cfm#Components

Otherwise I really like the KA1103. I especially like the attenuator. Unlike the Tecsun radios the Katio attenuator doesn't 'kill' the signal entirely. It merely shaves off excess noise. I like it.

Larry

3435. Re: R: Re: [de1103] Degen DE1103: LW band sensitivity

Yahoo group: de1103

From: <llanberg@...>
Topic: 3409 Message: 3435

I discovered last night something simple which greatly boosts VLF/LF reception on the KA1103. When using the supplied external wire for an antenna (passive, no preamplifier) on the low frequencies I noticed that I could receive beacons when my left thumb was on the speaker grill. When I removed my thumb from the grill the radio went back to being deaf. That told me that the radio needed a ground.

So, I 'grounded' my KA1103 to the electrical ground of my apartment. VLF/LF reception substantially increased. Like 100x. I was able to receive the 24 kHz U.S. Naval station NAA. Not very good, but considering the radio doesn't have the circuitry for VLF I thought that was an achievement. I could hear the 60 kHz time signal and then upwards of 200 kHz the NDB's started coming in real good.

For the radio's ground point I used the ground sleeve of the Line Out jack. The wire antenna never left my apartment, it was around my window.

Using the electrical ground is dangerous unless you're absolutely sure your home is wired right. In my case it made a huge difference.

Larry

I have just checked it and I got the same result. A good ground
connection is often as important as a good antenna for a receiver.

> So, I 'grounded' my KA1103 to the electrical ground of my apartment.

As a first test I connected the Degen ground to the metal frame of my
table lamp, which is connected to the house earth conductor. The
receiver was on and already connected to the long wire antenna, so I
could immediately note the improved reception sensitivity. Unfortunately
this place is a very noisy EM environment, so I couldn't receive
anything but electrical noise at VLF and LF frequencies.

> For the radio's ground point I used the ground sleeve of the Line Out
> jack.
The same choice I did.

Well done, Larry!

Hi Luigi, I too am in a high RFI environment. That's why I only use battery power. If I used the power adapter I'd get a loud buzzing noise on the low frequencies. The next thing to do is to get a high value inductor (over 1000 uH) and put that in line with the antenna wire. That should increase the results.

For some reason my KA1103 wouldn't take the LF preamplifier. Must be something in the circuitry behind the radio's antenna jack that cancels it out. Reception was totally dead when I plugged the preamplifier in. That's why I started experimenting with simple passive things.

I'm glad the KA1103 can at least tune down that far. Most radios can't.

I use only battery power, too; nevertheless I receive just electrical
noise inside my house on LW and MW.
In order to receive useful signals I have to stay out of my balcony,
like Juliet :-)

> The next thing to do is to get a high value inductor (over 1000 uH)

I have already tested a winding on ferroxcube (inductance above 1 mH)
with parallel resonance capacitor (77.5 kHz to try tuning the DCF77 time
signal), connected to the antenna input of the receiver, but with poor
results.
Perhaps I should connect earth to the receiver ground.

I have had frustrating experience with LF preamplifiers, too. The last
version of the DE1103 has two diodes as protection against ESD; moreover
some other limiting circuits may be present.

I decided to try my KA1103 on the included power adapter. I was pleasantly surprised -- no major noise to speak of, on longwave. A slight crackling sound in the background, that's about it. As long as I had the radio grounded I was fine. It seemed like the sensitivity was just a touch higher too, with the adapter. Most radios I've had couldn't be used on adapter power, period, because of overwhelming noise.

As far as in house electrical noise I learned to not only unplug my computer, but also disconnect my digital cable TV box. That puts out alot of RFI, yet I never see it mentioned in articles about interference.

Larry

That's interesting, however I'm a bit reluctant to use the ac adapter
connector: I had to trim its contacts because I found battery exclusion
contact always open. This led the battery current to flow across a diode
inside the receiver circuit, so the battery low threshold was too high.

I have no cable TV here but I have a SAT top box instead. I'll try to
disconnect its power cable.

3441. Static damage

Yahoo group: de1103
Date: 2014-03-05 14:23:49 UTC
From: <mikem6ymn@...>
Topic: 3441 Message: 3441

Hi every one,
I had a static charge from some place?
Any way, the Q1 has been damaged and needs to be replaced.
I have an MPF102 transistor, but can I use that?
And also I need the pin out for the original Q1 transistor so I can do a replacement.

Can any one help please?

TIA,

Mike.

From: <gx4aaw@...>
Topic: 3441 Message: 3442

Hello Mike

I would have thought an MPF102 would be ok.
Can't help you with the pin-outs of the original, but after you've cut the old one out, just check the DC resistance at the relevant circuit points with respect to -ve.
From the circuit in the group files section,
Gate - 100k
Source - 100 ohms
Drain - don't know!
Could be worth replacing the diode in its vicinity (D3).
A 1N4148 should be ok.

Good luck
Regards
Pete

Hi

Before you make a decision check out the Tecsun PL660
http://www.eham.net/reviews/detail/9935

Judging by comments here the PL880 is not as good as the PL660
http://www.eham.net/reviews/detail/11457

As regards the DE1103, you won't go far wrong with one of them, they're
a really good radio.

Paul

I guess it comes down to what you want to do with the radio, for hams I would go with the PL660, according to the reviews I read SSB on the PL880 is not the best. SSB on the DE1103 does work OK.

A major plus with the PL660 is the synchronous detection which can cut through adjacent channel interference.

If FM dx is a priority the PL660 will score over the DE1103: without a filter modification the 1103 has far too wide bandwidth for dxing, while the 660 is DSP; also the PL660 covers from 65 MHz - relevant if you are in Europe and want OIRT rx.
If HF dx is more important I'd stick with the 1103

I don't understand your request. Do you want to know where to buy a 1103 receiver? If so, go to EBay and search for DE 1103 and KA 1103. Same radio. You will find Chinese firms able to sell this radio at a good price. Keep in mind that this is essentially the same radio as the Eton E5 and the Grundig G5. If you find one of these look no further.

Hi
The Grundig G5 or Eton E 5 are harder to find. The Degen or Kaito
1103 are great radios for the price.

I don't understand your request. Do you want to know where to buy a 1103 receiver? If so, go to EBay and search for DE 1103 and KA 1103. Same radio. You will find Chinese firms able to sell this radio at a good price. Keep in mind that this is essentially the same radio as the Eton E5 and the Grundig G5. If you find one of these look no further.

If FM dx is a priority the PL660 will score over the DE1103: without a filter modification the 1103 has far too wide bandwidth for dxing, while the 660 is DSP; also the PL660 covers from 65 MHz - relevant if you are in Europe and want OIRT rx.
If HF dx is more important I'd stick with the 1103

Search for DE1103 on Ebay. There are several China/Hong Kong dealers offering brand-new 1103s with all the accessories. I have personally dealt with tquchina (SinoRadios) and Anon Co.and recommend them both. tquchina in particular has been very helpful and responsive.

Hi Hans,

I have all three and each has it's merits. My DE-1103 is a good little receiver, I bought it used but Q1 was out, I used a MPF-102 as a replacement and it was back in business. As for performance it does well on Short wave and FM. Being stable on SSB makes for good SSB HAM and untility reception. A good simple and basic receiver.
The Tecsun PL-660 is a bit larger receiver with a more conventional display, with out the traveling line. SYNC works very good on my unit with SSB being about average and on par with the DE-1103. I feel the FM is better on the DE-1103 but works fine in other ways. A step up from the DE-1103
My PL-880 is newest of the three and the best feature is the enhanced audio with the high tec speaker with it's bass reflex.... the audio is excellent! SSb is about average and mine works well with the best parts of the 880 being the fine tuning knob that is far superior than the BFOs of the 660 and DE-1103, the band width selection is very good with nice isolation on SSB and CW, this helps with faint stations on general short wave. Worst part(s) would be the lack of working SYNC and the fight with the DSP! SYNC is not really a selling feature of the 880 as it is not even mentioned in the manual, it does work but not very good and it is far better on the PL-660. THE DSP is nice but it is best to minimize the action of this by setting the level in the menus. Also the PL-880 is a menu driven receiver to a degree and that may be troublesome for some operators. It is possible there will be improvements on this receiver in the future.

3459. Latest DE-1103 DSP???

Yahoo group: de1103
Date: 2014-06-19 09:20:20 UTC
From: jaypolicow@...
Topic: 3459 Message: 3459

I bought a new DE-1103 as my original units both developed problems. I've noticed that this new one is quite different in performance than the older models. While it has digital hets on the AM band which the old models did not (very unfortunate), the FM is now incredibly sensitive and selective. In fact, in a recent shootout against several of my best portables on FM the DE-1103 amazed me that it was a top performer.

I'm surprised there have been no other comments about the fact that the latest generation DE-1103's seem to be completely different than the original models.

Does anyone have any information about this?

Jay

3460. R: [de1103] Latest DE-1103 DSP???

Yahoo group: de1103
Date: 2014-06-19 09:52:44 UTC
From: Luigi Candurro
Topic: 3460 Message: 3460

Hi Jay,
last generation DE-1103 receivers have some improvements with respect the older ones. One of these is two 1N4148-similar diodes in the antenna stage to protect it from ESD or similar overvoltage.

The supply stage has been also modified.

In my receiver I had to trim the spring contact of the external supply connector, which did not do a good contact and caused an early power cut off.

3466. 31MS active loop antenna

Yahoo group: de1103
Date: 2014-06-22 15:44:32 UTC
From: Luigi Candurro
Topic: 3466 Message: 3466

Hi all,

I'm using the Degen active loop antenna 31MS together with the Degen DE1103. It's a cheap and valuable antenna, effective especially on SW. Last winter I was able to receive two distant stations, from Northern Mariana Island and Guam Island, more than 12000 km far from my location.

However, I have noted that the 31MS control unit generate a RF noise at the frequency of 2.547 MHz, and relevant harmonics. The fundamental frequency is very strong, the Degen signal meter shows level 9 (full scale). The harmonic 2 (about 5 MHz) is a bit less strong (level 6), and so on for the other harmonics.

Have anyone noted the same behaviour?

Regards

Luigi

Dear Luigi:

I have the same loop and a Grundig G5 (almost identical receiver to 1103). I seem to get a spurious signal at 5054 or so with a level 9 reading on the s-meter. When I turn off the loop controller and switch back to the whip, it disappears.

I have no way of trying to detect it in the region of 2500 khz.

Otherwise, I like the loop but it doesn't give dramatically better results than the whip or my modest outdoor random wire antenna. Which antenna gives the best results all depends on circumstances.

RG

Hi Robert,

the frequency you have mentioned looks like the harmonic 2 of the noise.
I have checked the control unit with an oscilloscope: the noise at about
2.55 MHz is a low level signal but clearly visible at the control unit
output. This noise should originate in the DC/DC converter, needed to
rise the battery voltage to the tuning voltage (12-13 V).
A different choice of the DC/DC working frequency and a better filtering
could help, but a bigger inductor/transformer and additional components
may be required, difficult to place in the small unit internal room.

Luigi

3470. My "Degen 1103" died!

Yahoo group: de1103
Date: 2014-07-31 20:28:24 UTC
From: ALUIZIO ANTONIO DOS SANTOS
Topic: 3470 Message: 3470

He died and I could not resuscitates him despite "fussação".
In very good condition.
Only removed the antenna and one rear cap holding it high to put on another radio.
If anyone is interested I send, (Brazil only), by first class mail to be collected.
aluizio

Note
Just send me to pass the CPF.

Ele morreu e eu não consegui ressucita-lo apesar da "fussação".
Em muito bom estado de conservação.
Somente retirei a antena e aquela tampinha traseira que mantem ele elevado para colocar em outro rádio.
Se alguem se interessar eu mando, (somente Brasil), por sedex a cobrar.
Aluizio

Obs.
Só mando se me passar o CPF.

I enjoyed reading the various problems and potential fixes to these radios.
I have to say that the pictures of the PCB assembly show perhaps the WORST
quality I've ever seen in a commercial item. From the uncleaned flux to
the hamfisted transistor mounting to the horrible soldering of the
MELF packaged diodes , it's a miracle any of these things work!

Yes, PCB does not look good. Any way, it still works...we do not know how is it possible.

Regards

3473. Re: DE1103 or Tecsun PL880

Yahoo group: de1103
Date: 2014-08-05 22:33:07 UTC
From: jtcasejr@...
Topic: 3443 Message: 3473

Hi Hans,

There is a mini-review on the PL-880, PL-660, and the ATS-909X here: N9EWO - Dave's Radio News http://webpages.charter.net/n9ewo2/news.html

http://webpages.charter.net/n9ewo2/news.html

N9EWO - Dave's Radio News http://webpages.charter.net/n9ewo2/news.html 1. Waterfall screens, mouse operation, and other additional functions on the bandscope have been added. 2. An audio scope function has been added. 3.

View on webpages.charter.net http://webpages.charter.net/n9ewo2/news.html
Preview by Yahoo

I gather he will be doing a more complete review on these three in the near future. On his main page, he has a full review on the DE1103: Degen DE1103 - Kaito KA1103 - N9EWO Review - http://webpages.charter.net/n9ewo2/de1103.html

http://webpages.charter.net/n9ewo2/de1103.html

Degen DE1103 - Kaito KA1103 - N9EWO Review - http://webpages.charter.net/n9ewo2/de1103.html Good Construction Our DE1103 test sample's construction was of reasonable quality. It scores better than more current Degen models.

View on webpages.charter.net http://webpages.charter.net/n9ewo2/de1103.html
Preview by Yahoo

Dave was an editor for the now defunct "Passport to World Band Radio", and now has many reviews on his own page.

3474. First post and question about batteries

Yahoo group: de1103
Date: 2014-08-09 12:09:38 UTC
From: Ottavio Caruso
Topic: 3474 Message: 3474

Hello,

I am considering buying the DE 1130. I am temporarily located in the Netherlands, so my cheapest purchase options are from UK or German-based Ebay resellers (I've ruled out direct import from China because with added tax it's more or less the same price and a possible return to base would be more difficult).

1) I wonder if anybody has bought this device recently, because I've noticed that all resellers ship this radio without batteries, despite the picture of the batteries still being on display. It wouldn't be a major tragedy, but considering that the total price would be around 75/80 euro, it would have been nice to have some batteries.

2) In case batteries are not provided, I already have two sets of AA rechargeable batteries, which I would like to alternate when the first set is discharged. I've read horror stories about taking the batteries out while charging (I'm referring to the thread "Degen 1103 strangely dead after changing to new batteries"). Without duplicating threads, can anybody confirm me it is safe to take the batteries out?

3) Reading the group archives I had the impression that the charger would give a 100ma output, but the specifications of the adapter on Ebay says 8V 300ma. So which is it, 300 or 100ma?

Any other thing I should considering before firing the order? I would be using this radio mainly for SSB listening.

Thanks and keep up the good work.

I have bought the receiver last year from a Chinese reseller, and
batteries were included in the package.
I think you can find much better batteries on the market, e.g. Sanyo
Eneloop, both from the point of view of the capacity and the quality.

I usually don't charge batteries with the built-in charger, but with an
external charger/analyser I trust on much more.
I have changed batteries many times, with the receiver turned off,
without any problem.

The charging current is specified 100 mA in the user manual, but I have
never checked it.

Thanks Luigi,

is it possible that this is a new charger and that indeed it could be
a new repackaging of the receiver?

3477. Re: [de1103] First post and question about batteries

Yahoo group: de1103
Date: 2014-08-09 13:26:10 UTC
From: Luigi Candurro

300 mA is the current requirement for the AC adapter, the battery
charging current should be lower.

The receiver project has been reviewed, I think few years ago, in order
to fix some problems. Indeed I found in my receiver some components not
present in older revisions.

One thing you should be aware of: on the Degen DE1103 in SSB mode you can't select the sidebands (LSB/USB).

There is no explicit switch for LSB/USB, but you can adjust the
frequency by means of the SSB fine knob.

Try the US versions of the Degen radio - Kaito KA1103 comes with batteries and charger for US or the Kaito KA1102 both with SSB. and USA warranty through www.Kaitousa.com or on Amazon through Electronnix - actually Kaito USA.

It's not convenient for me to order from the USA as I'd have to pay
excess VAT. Then probably the adaptor would be 110V instead of 230V.

if the batteries you have are of same or nearby capacity, charge and use them.

you can remove the cells from the radio, without any fear. After some delay, you can place them back and check the operation.
all the best

Hello Ottavio.

The batteries are charged in the radio at 100mA - I have measured it. There must be a constant current charger in the radio as it doesn't change whatever the state of charge of the batteries. I have had my 1103 since about 2008 and never had any problems with lockup and I have always charged the batteries in the radio - not in an external charger. I use 2400mA/H cells which I charge for 30hours when the radio ceases to work. I have quite a few other radios to take its place when on charge! I guess the charge rate is kept low to avoid overheating in the radio. Don't buy a Kaito from the USof A unless you want a 115v charger.

SSB works fine for me, hardly ever use LSB. There is a trick to getting the best SSB sound which involves zero beating the BFO against an AM station, then marking the centre of the BFO knob with a spot of nail polish so you can return to the centre position any time. Most (all?) of my SSB listening is to HF aero which are on exact frequencies - 8867.0kHz for example - so the BFO stays in the centre position. Hams on LSB or USB may not be on exact kHz so you need to tweak the BFO to clarify their signals - but now you can go back to the centre!

Be very careful to avoid static discharge into the whip antenna - ground yourself to the metal front panel before touching the whip.

Overall a very good radio - doesn't take long to get used to the quirky ergonomics!

Cheers - Martin ZL2MC

3486. OT: ebay/paypal nightmare

Yahoo group: de1103
Date: 2014-08-11 11:50:19 UTC
From: Ottavio Caruso
Topic: 3486 Message: 3486

I've tried to buy the Degen de1103 from a uk-based ebay seller. As I have no ebay and no paypal account and don't want any, I've attempted to make my payment as guest. I filled all the forms, including credit card details, and pressed the button.

This is where the nightmare starts: the page was stuck with "Procession your payment..". After 45 minutes of no action, I've stopped the page.

I've contacted the seller by email (a free outlook.com account), but at the moment there's no reply.

I've checked in my bank account online, there's a pending transaction of £1 to paypal and that's it.

Does anybody know what could have happened? Of course, not being registered with either ebay or paypal, there's no way to check it online.

Thanks

Hi Ottavio,

I think the ? 1 is similar to EUR 1 charged during a pending
transaction, it will be cancelled as soon as the transaction is concluded.

Thanks.

Do you think that if I haven't received any confirmation from ebay,
the payment hasn't gone through?

How log should I wait to check that? Bear in my mind I was using a
guest account.

Sarma,

I don't have a Paypal account, I don't have an ebay account. Even if I created an account now, the transaction wouldn't appear.

Perhaps you can go to www.paypal.com http://www.paypal.com and register now. try once you get logged
whether the guest account that called for $1 , is there pending across newly registered account.

This is a normal part of the verification process. They typically put through a 1 or smaller denomination. When the transaction comes through, the 1 will go away. If no transaction comes through, after 10 days it will go away without being charged.

Obviously the transaction was interrupted before the transaction could be completed. I have purchased a number of items off of Ebay using a guest account, and the only way to tell for sure if the order was successfully processed is when you get an email from Ebay that the transaction was successful, and also an email from Paypal with your receipt for payment.

As you got no emails, your order did not go thru. You will have to do it again.

You can also go to the anon website and order directly from them, and avoid Evilbay and Paypal:

DEGEN DE1103 http://www.anon-co.com/product/de1103

It does come from China, but they are usually pretty fast.

I agree. I've never had a problem with PayPal and have used it for many years. When I did buy from a couple of dealers and the goods did not arrive, PayPal investigated and refunded my money very quickly. Can't ask for more than that!

The seller came back to me by email 24 hours later, without really understanding my issue. Despite the seller claiming to be in UK the IP address of the email clearly came from China. I think anybody can rent a fictitious address anywhere and then trade from China.

I am probably going to buy a kit to assemble a radio myself. Performance might not be great but at least I'll learn something. Imagine if there were problems with the radio, who know what I'd have to do to return it back.

What would happen if I change the batteries in my 1103 to normal 1.5V batteries? Not rechargable?

Thanks,
Bruno

If you charge normal Alkaline, or any battery not designed to be recharged it would not go well. At least they will heat up, possibly leak, and worst case burst. You will probably screw up the radio!

The ultimate way of checking to see if the payment has gone through is
to check your credit card statement.

Correct, it will be 110V go to your local electronics store and purchase
one but make sure the output volts are of the correct polarity.

I too have had problems after changing batteries but managed to fix the problem using the reset switch. Remember you're not using a radio but a computer that thinks its a radio. You have to treat it as such and you'll be ok.

3502. All european Ebay stores point to qpstore.com

Yahoo group: de1103
Date: 2014-08-27 07:34:42 UTC
From: Ottavio Caruso
Topic: 3502 Message: 3502

Hello,

have you noticed that at least all European Ebay stores selling the Degen state that they are based in Europe, but if you click on the seller details, they all point out to a Chinese phone number and they all seem to be connected to qpstore.com ?

Is this normal, legal and allowed on Ebay? Same thing on Amazon UK.

It seems to be this company opens puppet companies around Europe but everything seems to be running in China.

I've emailed a couple of them, they both replied as Jasmine or qpsstore?

Why would anybody trust these people?

Hi Ottavio

Thats no different to placing an order with Digikey's UK website and then finding that you get hit for import and customs duty as the goods are actually shipped from the USA!
They only need to have some link in Europe but can then ship and deal with the customers from anywhere they please.
Many companies have non-contactable stores and only give their head office number.
The huge LIDL and ALDI chains in Europe do exactly that. You can't phone any of the stores for information, only the head office.
Standard business practice but if you don't want to deal with them then thats always your ultimate choice

I am sorry but I don't think this is a choice given to me. If I am
told that the store is based in the UK and then it isn't, then I am
deceived.

I quite agree with you Ottavio.
However, I bought my Degen from qpstore last year.
It was posted to me from a UK address within a week & no import duty / customs sticker was attached.
A friend of mine also bought a Degen about 2 weeks weeks later from the same source, Unfortunately, his never arrived & he got a refund.
Of course, it may be that Chinese distributors can afford to have a stock-holding in the UK, but not all over Europe.
As with all things 'mail order', there's always an element of luck!

Regards
Pete

Hi Guys. There are many scams going on through ebay. For example most of the USB flash drives listed on ebay are smaller (memory wise) than advertised. Another example is the huge number of Chinese fake "shake" battery-less flashlights. I am sure that there are many other scams on ebay. Misrepresenting the item location is common on ebay. Ebay is not interested in stopping these scams, as they make a lot of money from the scammers. If you google scams on ebay you will get more than 10 pages of relevant results. Usually relevant results on google searches end on the second or third page.

Let the buyer beware!

3510. SSB degradation while using the external antenna

Yahoo group: de1103
Date: 2014-09-08 10:59:56 UTC
From: Ottavio Caruso
Topic: 3510 Message: 3510

I received my Degen last Friday, bought from Amazon.

Yesterday I went to the park and used the Degen with the external antenna all day, great ssb reception, then I went home and used the Degen on the balcony, using my extrenal antenna again. The ssb reception was horrible and voices were hard to understand.

So I reset the unit and took the batteries out.

Tried this morning, the ssb works ok if using the whip antenna but still not 100% if using the external one.

I wonder if the radio is damaged. Why would it work ok with the internal but not the external. The difference in signal is not great.

It sounds like it’s possibly overloading on the external antenna.
Check the DX/LO switch position. If it’s in DX (distant station) try using the radio with it set to LO (Local as opposed to distant setting)
It may simply be overloading the agc circuitry.

Yes

its overloading issue. What you could try is to use an anttenutor or Shortwave antenna tuner or align the sensitivity of the SW circuit with the external antenna connected and adjust for minimal distortion. I had to do that with the generic radio shack 20-629 ATS-505 SW radio! It now is not distorting like it use to.

What you describe is pretty typical of an overloaded receiver due to excessive signal that the ALC cannot handle.

One suggestion, rather than using the external antenna as provided, wrap 5-6 turns of INSULATED wire around the antenna whip and run the rest of the wire around your radio room. That should provide some added RF gain without overloading your Degen.

I find that with external antenna overload exist and some kind of LO oscillator modulation occurs. Not sure.

Thanks, I'll try that.

Should I also connect the ground point of the radio to the earth?
Would that give any gain in reception?

imho,
better to isolate the antenna from the Rx using a small 1:1 balun. I fear that few turns across the Rx would further aggravate the issue as the FET amplifier inside would amplify the signals. Instead , approved antenna pin connector would disconnect the internal amplifier and isolation helps reduce, so called, common mode noise.

Any ideas on how to build that? I've never built one.

I agree with others that the problem is signal overload. Do you live in a house or an apartment? What type of external antenna are you using?

What I have used with good results is an external antenna made from about 20-25 of wire connected to the center conductor of a length of coax. I ground the shield of the coax. The coax is long enough to get the wire 5-10 feet from the house. This setup may not be a good impedance match, but it does help to eliminate interference from home electronic devices.

3520. Line out to mic cable

Yahoo group: de1103
Date: 2014-09-13 10:37:43 UTC
From: Ottavio Caruso
Topic: 3520 Message: 3520

Hello,

1) has anybody been able to decode CW digitally with the Degen?
2) Can you feed the line out to the mic socket on a laptop? I have no line in.
3) Do I have to use a mono to mono cable or can I use one these off
the shelf stereo-to-stereo 3.5mm cables?
4) Can anybody recommend a free CW decoding software for both Windows
and Linux? Ideally if there was a live cd with all decoding tools and
software it would be great.

Thanks

Hi Ottavio. I tried this a couple of years ago. It only works well
with computer generated (IE perfect) CW. AT the time the software could
not deal well with the imperfections present in human-sent CW, small as
they might be. I had much more success decoding PSK and other digital
modes. On a side note, a friend and I were able to send and receive
computer generated CW at 100 WPM (neither of us could type that fast).
We were using Amateur Radio transceivers.

3522. No Sound!

Yahoo group: de1103
Date: 2014-09-29 10:01:36 UTC
From: clement65@...
Topic: 3522 Message: 3522

Hi,

Posted this in the Yahoo Grundig G5/ Eton E5 group.
Someone suggested that I post my query here as the radios are very similar.

Thanks.

Hi,

I tried your suggestion by pulling out the ribbon cable and reinserting the cable. But it does not seem to fix the problem for me.

Using a Grundig G5 which is identical to the Eton E5. There is no sound from the speaker or headphones.
The only way to use the radio is to use the line out jack to a pair of headphones (no volume control) or plug it into an amplified speaker. Other than this, the radio works normally.

Is there anything else I can try? Have tried the "reset" button but it does not work.

Thanks.

---In EtonE5@yahoogroups.com, <kb8dns@...> wrote :

The audio passes through the headphone jack and this may the point of error. The audio is controlled by a up / down control through the CPU to the signal board, there may be a bad connection with the ribbon cable.
Lastly the CPU has been known to "lock up" because of static.... easy repair for this is to remove back cover, and carefully unplug the ribbon cable, then reinsert the cable.... This usually resets the CPU and controls are restored.

3523. Problem With AM images on the Long Wave band and Shortwave Bands

Yahoo group: de1103
Date: 2014-12-25 06:05:25 UTC
From: gccengineering@...
Topic: 3523 Message: 3523

Hello,

I joined this group along time ago, but I forgot I was in it. I have 2 Kaito KA-1103 receivers that I own which is the gray version and the sliver version. The gray version was the second one I bought this month for a early Christmas gift, but it's been giving me harmonic reception problems on the long wave band using the ferrite rod antenna, but it seems that the discontinued Kaito KA35 active loop remidies the problem, but the silver one, the one that has a missing faceplate does not have this image problem. The problem is when I tune 198 kHz to beacon DIW trying to receive it, the gray KA-1103 starts receiving strong signal images / interference from WVXX-AM on 150 kHz and some other strong AM broadcast stations. The same problem also occurs with the short wave bands when I plug in the included long wire antenna with the 1/8 mono jack. It creates images like on 5 MHz from some other local AM stations like 1400 AM WPCE.

I wish that Kaito would start looking into this image problem such as design a MW signal suppressor for the LW and SW bands. The other side of this is that the silver one does not produce these problems and I bought that radio back 2012 from Radio Labs.

I bought this radio, from Kaito Electronics, the gray one, and I wish I could fix the image problems that are
occuring on the long wave and short wave bands. The AM and FM bands are find and also the short wave bands, just as long there is no passive long wire antenna connected. When I connect the KA33 active loop antenna, some other oscillation problems occur on some of the short wave frequencies, but it's not as bad as using a passive long wire antenna.

This reminds me that I too see differences between an original DE-1103 I've had since they came out and a newer one I got about a year ago, but I've never gotten an answer from anyone else commenting on this.

My newer 1103 is not as good as the old on one AM...it has digital hets which seems to indicate the radio was revamped at one time because the older models had, as far as I know, no DSP.

I don't know if the newer one I got is just a bad one and I should try a third, or if someone her can tell me that current DE-1103's have the all-too familiar digital noises on AM.

Anyone with any info on this or in general about changes to the DE-1103 in current production?

Thanks...and Happy Holidays to all!

Hi Jay,

I bought the DE1103 last year, but it is already the "classic" model.
What differences did you notice between the new DE1103 model and the old one?

Merry Christmas

Bought one in July, so it must be new. It is practically unusable on LW-MW, which I don't care much about. If you want a good LW-MW receiver you're better off with a regenerative receiver kit. They are fantastic on MW, although a bit tricky to operate. If you join the regenrx yahoo group, there are tons of good circuits for MW regen receivers.

Really the only differences I've noted are the digital het on AM...squeal and tones that mar signals which come in much more clearly on the original DE-1103 and the E5/G5 versions.

3528. Who uses the Degen to receive fax, rtty and other digital modes?

Yahoo group: de1103
Date: 2014-12-31 12:11:23 UTC
From: Ottavio Caruso
Topic: 3528 Message: 3528

I am fascinated by the idea of using the Degen to receive digital modes. I have read some partial guides and I know there is a line OUT, but I am wondering how to protect the radio from computer interferences.

I have wifi routers and PCs all around and I need to go in the woods to get a decent ssb reception.

Any ideas and experiences welcome.

I am able to receive digital modes simply by running the decoding programs on a battery powered laptop with the power adapter (a big source of noise) unplugged and by distancing the radio from the electronic stuff, using a jack-jack cable above 1 m long, tapping from the Line Out or headphones plug on the Degen. You can have fun this way and keep it simple.
To get a better S/N situation, you need an audio cable insulator (lots of bargains to buy one and howtos to build one yourself on the Internet) and a low noise environment (the woods, why not? :)

Sochibusi

When you posted "you need an audio cable insulator" I'm sure you mean an 'isolator'.
This isolates the PC input circuitry from the radio output circuitry and normally basically either uses a simple audio transformer or an optical isolator circuit.
As you say there are many designs on the web.

Can you recommend any?

> using a jack-jack cable above 1 m long

Does it have to be mono/mono, stereo/mono, or it doesn't make any difference? The standard is stereo/stereo.

Can you give me an example, please?

And my other question is: how can this shield the radio from the PC?
One should isolate the radio completely and let the aerial do the
receiving job. These world-band receivers cannot be completely
shielded (unlike regenerative receivers, where just connecting the
earth to the ground gives a massive boost in s/n ratio).

Thanks for that.

My objection was: wouldn't the radio pick up the interference from the aerial anyway? Unless one uses a very long cable and put the radio very far away...

I have a wifi router 15m away and that still makes my life a hell (especially on the lower bands up to 10 mhz).

I can use my de1103 in my shack with all my PCs and my router and I suffer no problems as long as I am NOT using the radio's own telescopic antenna.
Simply connecting it to my long wire antenna works well and most things I can hear on my IC701 are copyable on the Degen.
Using the radio's telescopic antenna is asking for problems as PCs, monitors, routers etc simply wipe out all signals . Also use it on batteries wherever possible and not with the power unit attached and on.

3536. Re: [de1103] Who uses the Degen to receive fax, rtty and other digital modes? - more on noise

Yahoo group: de1103

From: Paul
Topic: 3528 Message: 3536

You'll most likely find that it is NOT the router that is causing the problem but the switch mode power supply (AKA wall wart) that is being used to power the thing. The same applies to any other devices that are powered by the same type of power adapter. If you have a printer attached to your computer, pull the power plug for that too. It doesn't matter if it uses a power adapter or not.

I recently went on a noise hunt around my home:

First I tried the 'big fix' and turned off the power at the mains. The result? Almost total quiet. Now that I established that I was causing the noise the next step was to go on a hunt. It was like pealing an onion removing one layer of noise at a time.

This is what I found:

* DC power adapters were the biggest offenders, the modern ones being switch mode power supplies which have no transformer to drop the voltage. As it happened I had a number of power adapters that used transformers so I put them into service.

* The printer plugged into the computer. It didn't matter if the power was switched off at the printer the noise was no different

* The computer itself again merely shutting it down was not a total solution as it too uses a switch mode power supply that still provides power to the circuits on standby

That took care of the stuff at one end of the room, I then started ferreting out the rest of the noise sources

* The TV, like the printer it was another device generating noise when power was turned off at the set (not in standby)

* Another two power adapters for the cordless phone and router

* The Blu-ray player chucked out quite a lot of noise when it was supposedly switched off

Fixing the noise was simple - turn off the offending devices! Power boards with switches on each power point come in very useful!

I also found that using an external antenna can increase the received signals to such a degree that any noise that the receiver is picking up is drowned out. Like others have said, using just the internal whip on the radio is asking for trouble this is the same as using an inside

antenna to receive digital television.

Hi Paul,

there's a thread of mine dating back to a few months ago. Using the external antenna outdoor and above 14 Mhz is fine, but on lower bands it overloads the receiver. Yes I can switch from DX to local, but then I lose the extra advantage.

Unfortunately fax and utilities are in the lower bands.

In winter I have given up using the Degen indoor (outdoor is too cold!).

I had a very primitive regenerative receiver that I foolishly threw away, that performed better than the Degen on lower bands.

I am talking of usb/lsb, because I am not interested so much in AM/broadcasting. I used to be, in the good old times of VOA, BBC World Service, Radio Netherlands and so on.

http://wiki.radioreference.com/index.php/Connecting_Radios_to_Soundcards

Correct, isolator and not insulator ;)

Take into account that if your soundcard has a Line input, use it. It is
much better than Mic input that has a higher gain and saturates easily.

Thank you very much. A lot of stuff to ponder on. Now I'm travelling,
when I'm back in the UK I'll start developing on that.

3540. A couple of questions about loop antennas

Yahoo group: de1103
Date: 2015-01-10 19:24:45 UTC
From: Ottavio Caruso
Topic: 3540 Message: 3540

I was just reading an article on an old issue of Radio User (UK magazine). called "QRM adverse loop antenna". (I have a scan of it, I'm not sure I'm allowed to post it).

But first of all, a loop antenna is supposed to be connected to both the antenna input and the ground, otherwise it's not really a loop.

I see that somebody here used the Degen/Kaito active loop antenna, and if I'm not wrong it will only connect to the external antenna socket. I wonder if any other loop antenna would work without connecting the ground.

Thanks

Ottavio

Thanks for the link Luigi. My doubts are not displaced yet.

I believe the contributors to the thread on EHAM refer to "grounding" as connecting the earth of the chassis to a physical ground. In this case this is not required.

But the WB6BYU's post does go against what we learned years ago, when he says:

=quote=
An RF ground system doesn't need to be connected to the earth at all. For example, a set of quarter wave radials on a ground plane vertical. A balanced antenna such as a dipole or loop doesn't need an RF ground because all of the RF current should be flowing in the antenna itself. But an end-fed vertical or wire needs somewhere for the "other half" of the current to flow: if you don't provide some other low-impedance path it often flows back down the outside of the coax to the rig. So when I use an end-fed half wave wire antenna I also connect a quarter wave radial to the feedpoint and string it around the room.
=end quote=

But on an ordinary HAM receiver you still need to connect the other end of the dipole, regardless whether it's balanced or not, to the electrical earth.

I believe in the case of the Degen you can do away with it, because the signal is heavily pre-amplified and a proper full-size antenna would properly overload the receiver (even the supplied piece if wire does!).

In other words, I have these two doubts;

1) If the loop is not connected to the earth, would it still shield the receiver from interferences;

2) Is is worth it at all?

Sorry for being pedantic.

3543. External antenna socket, was: A couple of questions about loop antennas

Yahoo group: de1103

Apologies to all.

I need to rephrase my earlier question.

I had assumed that the external antenna socket would not connect to
the electrical earth or ground of the receiver.

My question now is: is the external antenna socket of the Degen a
proper socket in the traditional sense and what impedance would it
require?

I do not know what the antenna impedance of the DE 1103 is. I do know that the antenna impedance (external antenna jack) for the Grundig G5/Eton E5 is 50 ohms. I also know that the DE/KA 1103 is almost identical to the G5/E5 in general. But . . .

I also know that this is the way that the external antenna jack works on the G5/E5. The jack needs a a mono miniplug: The tip is Ant and the sleeve is Gnd. I have used antenna tuners that require both A and G connections with the Grundig G5: if A is tip and G is sleeve everything works perfectly. I have also used the Kaito/Degen shortwave loop antenna with this receiver. If you you plug the mono miniplug into the the external antenna jack, the antenna works impressively. It connects to the A and the G connections of the receiver.

On the Grundig G5, and I think the Eton E5, the external antenna, when plugged in, substitutes for the whip and the loop antenna all the way down to the Long Wave Band. The internal whip and loop antennas are switched out. As a consequence, for example, you can use a preselector to select out interference in the Long Wave band. I don't know if this is true for the 1103 or its Eton successors, such as the Grundig G3.
Best.

The Degen DE1103 works in the same way: the external antenna socket
requires a 3 mm mono plug; the tip is the antenna wire, the sleeve is
connected to the receiver ground (battery "-").

In the Degen, the external antenna plug, when inserted into the socket,
disconnects the internal whip antenna, not the ferrite one.
Ferrite antenna is disconnected if a simple trick is adopted, a sequence
of keys that enable the reception of signals in the 0-100 kHz band.

3550. Back to the "Loop antennas" topic...

Yahoo group: de1103
Date: 2015-01-12 18:46:55 UTC
From: Ottavio Caruso
Topic: 3550 Message: 3550

Thanks Luigi and Robert for the clarifications.

I have spent the whole afternoon reading about (active) loop antennas and RFI's.

It is clear for me that, at least indoors, RFI's are the bottleneck, to the point that I have shifted my attention to VHF and software defined radio. Pity!

Before talking about the virtues of this or that active antenna, I need to know if a loop antenna, whether passive or active, can help in any way to shield at least part of the internal RFI's caused by cheap power supply and/or wifi equipment.

I live a very mobile/semi-nomadic life, in other words I spend most of my life in (cheap) b&b's and guest house. I am surrounded my RFI's. I can't tune into anything valuable on my Degen. My interest is mainly on the 80/75 and 40m ham bands.

Am I going somewhere using a loop antenna? If so I could start with the Degen/Kaito/TG34 and start experimenting.

Is it true that passive loop antennas for SW are worthless?

Does the Degen/Kaito/TG34 tune on the 80m band?

Is there anything that I can put between the wire antenna and the receiver to filter the RFI out?

Thanks

Ottavio

I finally had the guts to remove the ribbon cable on both my G5 and G3's (same cable) about 2 years ago. They seemed so tight I didn't think it was possible at first, but others here had done it. There is no locking mechanism; just grasp it securely and work it side-to-side as you pull it back and it should come free.

Hello,

I am a new user in this Group. I am currently using my Sony ICF-2001D as my Primary Radio and just got the DE1103 as a backup.

I wonder if there, arpart from the colour of the cabinet, different Versions or if improvements have been done to the radio during the years. I saw some photos where the radio and the keys are brightly illuminated by orange light. Is this what the Radio originally looks like? I have in mind that there are also Radios with a much weaker green light.

cheers,
Tim

welcome to the group.
while seeking status,
it is better you indicate your Radio receiver serial # and year of make. etc so that those who could answer based on your report.
if tour's is latest , all the old mods may not be warranted.
all the best of reception.

Hello,

my favourite bands for listening are the 160 and 80m bands.

Where can I find (or how can I build) a reasonably small receiving loop antenna for these bands? Or at least for the 160m could I use an external ferrite antenna?

All loop antennas seem to be built for >= 4 Mhz.

Thanks

Ottavio

I'll give a look at it.

3562. Sensitivity of Kaito 1103/Grundig G5

Yahoo group: de1103
Date: 2015-02-28 06:15:21 UTC
From: rgorsch@...
Topic: 3562 Message: 3562

I remember when I first got my Grundig G5 and started exploring around for information about it hearing from "old hands" that I shouldn't expect it to be more than it is, a little portable and a travel radio, not a full performance table top shortwave radio. When I first got the radio, however, I was astonished. My "tabletop" at the time was an old Panasonic RF 2800 whose performance seemed pretty satisfactory to me, particularly because its audio was so good and so adjustable. I was astonished because it seemed to me that the Grundig G5, using the whip antenna only, clearly outperformed the RF 2800 using an outdoor random wire antenna and an apparently effective antenna tuner. Ever since that time, my G5 has become my "tabletop" receiver used with and without an outdoor antenna .

Anyone have similar experience?

3563. Re: Sensitivity of Kaito 1103/Grundig G5

Yahoo group: de1103

From: policow6@...
Topic: 3562 Message: 3563

Yes and no. The Eton Grundig G5/E5 and original Degen DE-1103 (NOT current production versions which are inferior on AM) were the best performing radios in their size category I'd ever owned at the time. As stand-alone portables (using built in antennas) they outperformed any other radios of similar size in terms of RF performance I had ever seen. After that, with the advent of DSP chips, although SW performance was still good and FM improved markedly, AM performance took a nose dive...the early DSP sets had great selectivity and filter characteristics but they had whines and hets which ruined their AM perrformance.

Current DSP products have begun to solve these DSP AM problems and the hope is that eventually all DSP radios will be as good as the one G5/E5/DE-1103 were. The DSP chips also have a horrible feature called soft-muting...that is reduced or disabled in some models but in others it is a real pain.

However, no radio on its whip antenna should match the performance of a radio using an outdoor random wire ASSUMING that antenna is properly installed (which includes use of coaxial lead-in, balun and proper grounding), and if the radio it is connected to can take advantage of such an antenna...many portables cannot.

So, good as the G5 is on its whip, if it is beating another radio with a 100 foot random wire, I would look to what is wrong with that setup.

Regarding the signal reception of the Kaito 1103, I have been amazed/even pleasantly puzzled by how well it works with simply the stock telescopic antenna. In addition, I, too, have comparably tested it with a long/random wire and many times pull in signals just as well with the stock telescopic antenna. The older I get the less I know.

HI
I have a Kaito 1103 that does very well with a whip antenna. It's
over five years old and the top part of the whip has broken off as well
as the plastic stand in the back but it is basically the same radio.

I've found performance on shortwave to be very good but when I compared it with the Redsun RP-2100, I found it to be slightly inferior. The difference was the Redsun had a slightly better signal to noise ratio. Another great performer on shortwave is the Tecsun PL-660 and performs about the same as the other two. On medium wave I've found the Tecsun to be deaf.

As regards medium wave, I wish the 1103 was around in the 70s, it would have been interesting to see what could be heard when the band was less crowded and we were still on a 10 kHz split. But I digress, last night I was hearing Radio Marti 1180 kHz from Marathon Key, Florida at a readable strength, this was despite a station being on 1179 kHz. I am in Christchurch, New Zealand, the adjacent station was located in Auckland approximately 1073 KM away. Reception was marred by a moderately strong heterodyne which is to be expected because of the 1 kHz difference in frequency.

I understand they are using the same PCB.... My E5 is off frequency on AM only by about 15khz.

How can I get this calibrated to correct this , is they a calibration point on the PCB at all?

3569. Memory back up?

Hi,
Is there a station memory back up in the DE1103 even when batteries are empty?
Mine was without use for 2 years and I charged it again and appearently it had kept all station memories!
Thanks and 73,Bruno in Belgium

Hi friends,
I have been using my DEGEN DE1103 since May 2011. From today morning, I am not getting any audio on speaker as well as on headphones. But whenever am changing the band a crackling noise is emanating. I have made two resets but the outcome is negative. Please help.

Hi Bruno,

DE1103 retaines stations frequency and alarms settings, even when the
batteries are removed for a not too short time.
If the battery replacement is fast enough, no setting at all is lost.

Doing a bit of exploring with Linux, I found this discussion about hacking everyday electronic items. I thought this may be a way to solve the purpose of the unused pins on the board when the cabinet is opened.
A bit of hacking just may reveal the lines of code that permit the radio to operate and perhaps allow software repair of reboot of the firmware.
I myself are not quite on target for the hack and this would be better as a group function.
Here is the You Tube link....

3581. Need Technical Assistance With Ferrite Rod Connection

Yahoo group: de1103
Date: 2015-10-18 07:14:33 UTC
From: gccengineering@...
Topic: 3581 Message: 3581

I was trying to look at the defective KA-1103 which was the gray one to see what is wrong with it, and I needed to reconnect the thin litz wires to the board. Which wires go where back on the board.

On the board I see ANT 1, ANT 2, and ANT 3, but I don't know where the red thin wire goes and the coupling pick up coil where there are only 2 turns of wire. I tried to study the schematic, but it does not say ANT 1, 2 and 3 on the schematic diagram.

I am trying to restore the receiver after I get the right technical data to reconnect the ferrite rod antenna.

Please let me know, Thanks!

I got it working anyways, but using another radio that I have already. The ANT 1 connects to the red wire of the main coil and the ANT 2 and 3 are connected to the thin 2 turn coupler coil. I am thinking about rewinding another coil, possibly get the LW-MW bands better performing. I just saw some pics in the files section that the Kaito KA-1103 has a less turn coil and the DE-1103 that has a real good turn coil for LW and MW which will help cover 100 kHz to 1710 kHz. I also took a picture of the circuit board with the 3 coil wires from the other radio that I have already.

The DE-1103/KA-1103 have undergone several changes during production so the differences you note may be due to date of production rather than Kaito versus Degen labels. For example, the models from a year or two ago suffer form a bit of digital noise on AM which was not present on the original versions. There is a very good likelihood that the chips have changed and that could account for different windings on the ferrite to match the new chip's input characteristics.

3585. Eton E5 no receive

Yahoo group: de1103
Date: 2015-11-04 09:51:51 UTC
From: heetee357@...
Topic: 3585 Message: 3585

Hi I bought a E5 a few years ago from value village but it did not work.
It just had hiss sound.
I opened it and found ZS1 to be extremely hot and thought it was bad.
I shelved it and today finally got a replacement 3v regulator.
It too was hotter than a firecracker so I stated yanking caps and found C406 was the culprit.
When I first installed the new regulator, the radio worked after I bumped the tuning knob but the frequency drifted and that's when I discovered the regulator was hot.

So after replacing C406 the unit works great on FM, its on right now as I type this but the entire HF band is deaf.
I tried my CB on 27.385 and could just barely hear a muffled garbled signal.

The S meter does nothing in this situation and on FM it will not work either.

Changing the 220uF caps was very difficult on this radio and I had no luck getting HF to work.

What could be the trouble?
Would FM work if the FET Q1 was popped?

Any advice would be appreciated, thanks.

Thanks for letting me in also,

73's

Chris

3586. Re: [de1103] RE: Degen 1103 strangely dead after changing to new batteries

Yahoo group: de1103
Date: 2015-11-20 19:52:43 UTC
From: Ramiro Aceves
Topic: 3364 Message: 3586

Hello,

After two years of perfect working radio after resurrection, yesterday I removed batteries for charging and ended again with a deaf radio in all bands, MW, SW and FM. I could not hear anything. Volume control worked and I could hear a background hiss. The hiss was the same for all modes, FM, MW and SW.

I have pressed the RESET buttons several times and still does not work.

I have opened the receiver, removed the shielding metal as I did before and shorted to ground every microprocessor pin. The Degen has come to life again. Some microprocessor pins mantain two or three hundred of millivolts after the radio is switched off too long time.

I seems that this resurrection procedure works.

Regards, Ramiro, EA4NZ.

3587. KAITO 1103 - BEING DISCONTINUED????

Yahoo group: de1103
Date: 2015-11-21 18:09:56 UTC
From: BikePackin@...
Topic: 3587 Message: 3587

I have learned from credible sources that the Kaito 1103 is or has been discontinued.
Is the same happening to the Degen 1103?
Thanks.
P.S. PLEASE FORGIVE ME IF this topic has previously been covered .... I do monitor the DE1103/KA1103 messages pretty closely and have not noted it.

Ask them about the Degen.

My feeling is, we'll never have an official announcement, as the Degen was
made for the Chinese market.

Looks like it's just been upgraded. I have two of the old ones, one had the blown JFET issue that I was able to fix. I thought often of pairing it up with a QRP transmitter. I believe it has been done. Got a lot of non-started radio projects here.

Looking at this DSP version, it seems they are not using the DSP chip to it's fullest - by a long way. The one thing I was looking forward to, over the analogue DE1103 that I have, is the ability to select multiple bandwidths. It looks like you have a choice of just the standard wide and narrow. If the same bandwidths are kept as now, that would be OK for AM, but not sufficient for SSB. You need a narrower filter for decent SSB reception on a busy band (say 2.4kHz), and a narrow filter of, say, 500Hz for CW would make this a rather nice radio. The DSP chip can do that I believe. There are portables out there that offer multiple DSP bandwidths. It says the DSP also supports RDS, but it is not implemented in this version. If it is not implemented, then switchable FM filters would be a useful feature (say 80, 100, 130 and 200kHz, or even just 100 & 200kHz).

Even though the DE1103 is quirky and has odd ergonomics, I still really like mine and it is my preferred 'take along' radio when I am travelling.

The new DE1103 with the Silicon Labs Si4735 chip that I ordered from bigbargainonline http://myworld.ebay.com/bigbargainonline has been shipped. I should get it in 2-3 weeks.

Most DE1103 suppliers on Ebay seem to be supplying the old version.

blockquote, div.yahoo_quoted { margin-left: 0 !important; border-left:1px #715FFA solid !important; padding-left:1ex !important; background-color:white !important; } Greetings:
I just purchased the new de1103 with the DSP chip. It arrived Saturday and I've been using it since then. Here are my impressions: the swling.com review is accurate there are a lot of images and bleed-through from to local am stations here. Not enough, however, to make me not use this radio. The ergonomics are strange, as is the tuning and volume controls. Still, a very impressive radio, and once you get past the learning curve of using it, turns out it is a fun radio to use. I quickly got used to DSP tuning, and the slow AGC. It quickly becomes like an odd relative - you know the cousin or uncle that's a bit quirky, that you have to treat differently from the rest of your family, but who you end up liking a lot because that person is so different.
The 1103 is sensitive on SW and AM. I live away from the city, in a development with no rf and with buried power lines so there is no interference. This little radio with just an indoor long-wire picks up a lot of faint stations as well as amateur. The SSB is easy to use. AM is amazing for DX and even considering the propagation has been in the tubes lately. This little guy can really pull things out of the air.
I can see why this radio is so popular around the world, and not just the price point. I like radios that are fun and this one is a lot of fun to use. I don't know what the previous version was like before the DSP, maybe I'll try to pick up one used. The review made my heart sink a little when I read it, but Iater after receving mine and a few days of playing with it I would not sell this radio quirks, images, less than great ergonomics and all. My 1103 is a keeper.

3601. First impressions and remarks on the DE1103 DSP

Yahoo group: de1103
Date: 2015-12-25 17:50:50 UTC
From: jeanlucfradet@...
Topic: 3601 Message: 3601

Hi everyone,
I just received this radio, hoping it would be the old highly praised version, and unfortunately it was the new DSP version about which I had not read too much good.

A few things I have noticed : It works OK when entering a frequency with the keypad or or one stored in the memory but very unpleasant to tune in because of the « soft tuning » and the sharp volume increase when you are on the exact frequency. But it must be the same with all DSP receivers I suppose, and it takes time to get used to it when you are accustomed to smooth analog tuning of the old days.
I have not remarked overloading or bleed through from strong local AM stations because there aren't many AM stations in France (and none at all after december 31 !)
I do not like the unique 1 khz step. Why not have implemented 1 - 5 - 9 – 10 kHz selectable steps like on any other radio ?
I also regret the only two selectable IF bandwidths of 4 and 6 khz. 6kHz gives good clear audio, but 4 kHz gives a muffled sound (as should be expected)
Low sensitivity on Long Wave (although much better than the Tecsun PL 380 which is totally deaf !) Noisy reception of BBC radio 4 here in central France, a station which usually comes loud and clear on any old pocket transistor radio of the 1960's. Also noticed that the signal strength indicator did not work at all on LW even with a 2 megawatt station 60 kms from here. The external antenna does not work for LW and MW, by the way. Only the internal (and presumably very small) ferrite antenna works.
Medium Wave sensitivity is OK . I was indeed surprised to catch the Caribbean Beacon on 1610 kHz and Faro de Santidad on 1660 yesterday morning.
Shortwave sensitivity is quite good. Yesterday I was listening to Radio Australia on 12065 and Radio New Zealand on 9700 with only ONE SECTION of the telescopic antenna.
SSB works and is quite pleasant to listen to once you have managed to clarify with the BFO, which requires a lot of patience. There is also a loud noise produced by this BFO at half course, probably because of the one kHz jump.
Ergonomics is quirky. The only knob for tuning and volume is certainly not the best concept. Nor is the useless fake analog style dial. This space could have been used to display more useful information.
Nothing special about the FM band. It works perfectly well like on any radio.

In short, this small radio is very nice to look at and fun to use. It just takes a bit of time to get used to its quirkiness ! And if it can receive Australia, New Zealand and transatlantic DX on MW I will certainly keep it and not send it back like I did for the Tecsun PL 380 (the worst radio I've ever tested although highly acclaimed !)

73 de Jean-Luc (QTH central France)

3602. KA1103 audio improvement

Yahoo group: de1103
Date: 2015-12-26 13:54:17 UTC
From: Jim B
Topic: 3602 Message: 3602

I have always been fully satisfied with the AM and FM DX capabilities of the radio, but I found it very difficult to listen to weak stations through the speaker. Yesterday I plugged some ccrane cc buds ear phones into it and the audio sounded 100% better. It is crisp and clear and much quieter. Was debating whether to take it on an upcoming trip, but now there is no doubt it will be going. I have had these ear buds for almost a year, but for some reason never tried them on this radio. Jim

3603. Re: [de1103] My New de1103

Yahoo group: de1103
Date: 2015-12-29 00:07:14 UTC
From: martin_cook@...
Topic: 3598 Message: 3603

In the early version of the DE1101 IMHO there was some confusion about the 'wide/narrow' switch, I suspect brought about by the way that the handbook is written - page 21. The sentence in the middle has nothing to do with the switch, it states that the 1st IF is 55.845MHz and the 2nd IF is 450kHz which is true but badly worded and does not explain what it really does.

There are two ceramic filters at the 450kHz IF, diode switched from the "W/N" switch on AM only, 450KA, U5 and 450KB, U4 - they don't say which is the 6kHz and which is the 4kHz but a block diagram from "Phil" shows it clearly.

On FM all that the "W/N" switch does is add in a bit of top cut to make it sound more bassy, by adding two capacitors across the FM audio lines, C316 and 317, 103pf (I suspect that is 10,000pf)

Perhaps in the new DSP version the wide/narrow function is in the DSP processor, or is the DSP section merely in the audio stages?

Hope Santa bought you some nice goodies to play with.

Cheers - Martin ZL2MC

Is possible to fix the optical encoder or find a replacement for it. Mine gets stucked to a frequency. And rotation of the jog dial doesn't change frequency.

Maybe the grease inside got dry.

I have the 1103 and 660, I've found which is the better of the two depends on what you are using it for. On shortwave the two are about the same but on medium wave, the 1103 is more sensitive. As regards FM, the 660 seems to be less prone to overload than the 1103 which in my location is hopeless.

I'm not sure if we are talking about the same antenna,if you mean the powered DEGEN antenna, it is very poor in comparison with an external wire ant. of any kind, my opinion. I hated the DEGEN/KAITO antenna! In fact, I gave mine away to someone who wanted it. A loose piece of random wire performed better than that.

Hi,
Really! If we are talking about the Kaito loop antenna, mine performs very well.
I live in a condo on the 5th floor here in Niles, Illinois. Niles is a suburb of Chicago on the Northwest side. Lot of noise here in my receive location. I set my loop up next to an outside facing window. The only downside was I need to tune to frequency very very slowly. If you don't you will miss the peak of that frequency. It took a little practice. But my expirence is when the antenna is tuned dead on FREQ it removed a lot of the generated interference in the condo and outside QRM from the received frequency. It was the difference between hearing many SSB ham radio QSO's and not hearing them at all. You need to keep the battery ☐ fresh also. If it gets the least bit weak the antenna losses a lot of receiving ability.
I have had very good luck with the Kaito loop. For the money, it beats any indoor wire antenna ☐. Anyways, that's been my experience with the Kaito loop antenna. Hope this helps you in your decision.
Thank you,
Paul Juarez

I've used the Kaito loop also. I have moderate problems with local noise interference (TVs, computers, etc.). The loop often gives strikingly good results, a clean signal where other antennas (indoor and outdoor wires) give mainly noise
or a very noisy signal. I don't have a good outdoor wire antenna, only a poorly positioned random of about 40', so I wouldn't be able to compare it properly to a serious outdoor antenna. So sometimes the loop works quite well, depending upon circumstances. I am glad I have it. I don't think it tunes below about 4 mhz., though.
Robert

Hi Ottavio,
I do most of my SSB Ham listing in the evening. I listen mostly to the 75 meter ham band mostly because I can usually catch both sides of the conversations. Again, even 160 meter ham bands seems to be cleaner of my condominium home interference. However, depending on the season there may be more static crashes on the 160 meters ham band.
I find the reception improvement in all SW bands to be greatly improved. However, with my loop I have to tune very slowly and keep the batteries fresh.
I do not have an outside antenna here in the city. The Condominium Association will not allow that. I use to use a long wire strong up inside my radio room near the window. it did improve reception somewhat but the long wire also increased the noise level. So from a DX standpoint there was not much improvement in in the amount of received stations. But with the Kaito loop the noise level is decreased a lot. It allow for radio signals to come through. Plus the signal level is much stronger. I was really surprised because I did not expect much for a $39 loop antenna.
I just tried it because I had a gift certificate from Amazon because of all my orders. So I took the chance. For me it was a positive move. for no more then it cost it has performed very well. It has allowed me to enjoy my favorite hobby.
73's!
Thank you and best regards,
Paul Juarez

Jean-Luc:

I hope I am not breaking any rules but anon-co has replacement back stands for the 1103 for 4.99 with free shipping. They also have replacement battery doors, and though they are not listed you can get replacement switches (like DX/local) which they will send for free but you have to contact them by email. Anon-co is Essy to find on Google.

I have the DSP version. I like it but it it mutes like most DSP radios if you are not used to DSP radios you may not like it. I've had fun DX-ing MW with it. It has images from local stations bleed through if you set it at local when you get an image they tend to dissappear. I have the traditional 1103 and I love this quirky radio and the DSP version.

Hi Dave Raff,
Nice to here your evaluation of the de1103 DSP. I almost bought it. However, I read ☐ about the image issue with the radio ☐. So I bought the Duel Conversion ka1103. I have been pleased with the radio.
However, I plan on doing the Modifications to it as per the Russian radio site. All in all it is a very good receiver.
Thank you,
Paul Juarez

Hi D Raff,

Thanks for the info about the back stand. If I don't manage to fix mine, I'll order one but you have to admit it is very fragile and may break easily.
I have no problems with local AM stations because there aren't any left in this country !

Hello

The backstand on my Kaito 1103 broke years ago but the radio is rugged.
Mike

3627. 1103 tunes through unprogrammed memories

Yahoo group: de1103
Date: 2016-03-23 23:03:07 UTC
From: a1aop@...
Topic: 3627 Message: 3627

Hi all,

I have two 1103s. the older one jogs through the programmed memories in a continuous loop. The newer one for some reason continues on through the unprogrammed memory positions. I've had these radios for sometime but only noticed this now because the newer one was in storage and not used much. It's annoying since I consider this radio to be the best one in my small collection of small portables.

I've checked the manual but I didn't see this issue addressed unless I missed it. There are no mods done on this radio. Maybe something got turned on or off on initial setup? Any ideas?

Jerry.

Come to think of it, when searching there or anywhere for that matter, check for replacements for the Eton E5 and the Grundig G3 and G5 . They should fit also. I personally wouldn't be averse to experimenting with the appropriate size small plastic cap and getting creative with some mold-able epoxy to form the female end.

I searched EBay and generally through Google but could not find any source. There is one company advertising replacement battery cover and tilt stand. I just received a reply from them and they are now listing the knob. I ordered one as well as the pouch they have. Will see how successful they are and let the group know.
I want to keep it original if possible otherwise I imagine something could be found to do the job. If I had a 3D printer, perhaps I could make my own.

This is where I ordered from:

Thanks for the thread here. After reading these interesting postings I decided to inquire for the eventual availability of a replacement part for my DE1103's optoencoder (not working properly after 8 years of use.. I bought the set in 2006 in Europe). I got an immediate reply from Anna, that that would be possible. Here's her response:

*We may be able to send you a replacement for the tuning encoder of your DE1103, but we do have a question about what your current encoder looks like. At some point the manufacturer changed the tuning encoder of the DE1103, so we need to make sure that we have the encoder you need for your radio in stock. Would you be able to open your radio and make a photo of the encoder? We can then confirm to you if we have it available or not. *
So, you see... Nice people!

You are correct Horacio, nice people indeed to offer such detailed help. Rare in the small portable SW radio world I would think.

I imagine you would have to send the part number on your units encoder or email them a picture of the disassembled part. I envy you your skill if you attempt the replacement. I have a replacement encoder sitting here for small HF transceiver. After looking over the very fine de-soldering and soldering I would have to do I lost confidence in a successful outcome. I just endure the skittish multi function knob. If it totally goes then I'll attempt the repair.

Good Luck if you attempt the replacement.

Subject: Re: [de1103] Re: Spare parts

I searched EBay and generally through Google but could not find any source. There is one company advertising replacement battery cover and tilt stand. I just received a reply from them and they are now listing the knob. I ordered one as well as the pouch they have. Will see how successful they are and let the group know.

I want to keep it original if possible otherwise I imagine something could be found to do the job. If I had a 3D printer, perhaps I could make my own.

This is where I ordered from:

I received the knob and soft pouch for the radio a few days ago. Quick service and the knob fits perfectly. Anon did say they would add the knob to their web site and good to see thay have. I suspect they will add more parts as people find them and make enquiries about other parts.
The soft pouch fits well so will help protect the radio but won't stop the knob getting knocked off of the radio. The pouch has Grundig G3 on it but I can live with that.

Don't know what it is with that knob and why it keeps falling off, had that happen to me on a trip this week. Luckily it was still in the pouch I use to carry it and an 1102. Must be the shallow receptacle.
I use a G5 pouch for my E10 when I want to bring a radio with more room filling audio.

3641. DE1103 stuck on Telescopic whip below 1700 khz

Yahoo group: de1103
Date: 2016-05-06 16:23:58 UTC
From: peterconway.ndb@...
Topic: 3641 Message: 3641

I have 2 DE1103 rx's and pleased with them.
1 now has a problem with one where the telescopic whip is active on all frequencies LW/MW and I cannot clear this problem. Tried the reset button.
I know that you can scan down below 1700 Khz and memorise a channel - which then has the whip active. But I seem to have the opposite and can't get back to just using the ferrite rod on the MW/LW !

Any help?

Peter

[quote from one of the files...].

Originally in the factory version, when tuning below 1710 kHz the ferrite antenna is always connected, the whip antenna in this case is disconnected. The same rule remains in "the opened" DE1103 when tuning frequencies under 1710 kHz in the usual manner (straight frequency recall from memory or using the range change buttons). But if we "enter" the extended frequency below the 100 kHz range via the memory recall at the "low" frequency, then going into manual tuning by repeatedly pushing the "M/F" knob, as it was described above, this tuning method will use the whip antenna. Then by tuning using the knob to raise the frequency, the whip antenna remains connected. However, the radio goes back to the ferrite antenna when you tune at frequencies below 1710kHz using the normal method (by recalling memory or by changing the range.

3646. KA1103 going off calibration

Yahoo group: de1103
Date: 2016-06-19 01:26:13 UTC
From: Cekart Moezher
Topic: 3646 Message: 3646

Hello, I have been a member of this group a long time, and I thank everyone who has posted something because i learned from you gys, a lot. This time is my turn to ask for help though.I bought a KA1103 back in 2011, so it is the old model, do not know specifically which one because i have never opened it. I had not used it for a long time, almost a year i think, but the other night a storm left my whole neighborhood without power so I thought it was a great time for some DXing. So I turn on the radio and started to tune to some stations, and I noticed it was off by .05 mhz on FM, meaning if the station was on 102.9mhz, I could only get it to sound right at 102.85mhz, if I went to 102.9mhz, it started to sound like I was starting to go away from the freq "center" so to speak. so I changed to MW, but did not see any noticeable changes there. Then changed to SW, and noticed that when tuning to a station, there is a buzzing sound like when you are on SSB and are aproaching a strong station signal, but the SSB switch was off, so if I turn it on, the sound almost goes away, but not completely.
That is why I think the "calibration" of the tuning may be off, the thing is that it seems to be affecting only FM and SW (so far). I suspected the antenna processing had something to do, because MW uses the ferrite antenna, so I pulled the trick where you make the radio use the telescopic antenna on MW, but did not see any change, and also tried with 3 different external antennas (magnetic loop, random wire, and an active loop) to no avail.
Might the crystals be getting "old" or something?

The SDR would need to sample the IF at the higher frequency of 55.845 mHz on the DE-1103. A buffer stage would also be needed to allow this sampling without affecting the tuning ability of the Degen. Much can be found by doing a search for input buffers.
One set up one would have to adjust the software to have the correct frequency shown or sampled. Here is a page that lists many SDR software programs....

http://www.rtl-sdr.com/big-list-rtl-sdr-supported-software/
http://www.rtl-sdr.com/big-list-rtl-sdr-supported-software/

SDR# is one of the more common programs used and is simple to use. I would recomend the use of shielded or screened antenna feed lines to lesson the chance of RFI from the computer and hook-ups from getting into the receiver.

I would say it is not the crystals but more than likely the electrolytic capacitors, one or more. Usually storage for a long time, even several months can let these capacitors loose their 'form'.
An electrolytic capacitor depends on a very thin film of electrolyte between the two plates, This electrolyte allows build-up of electrons to allow the capacitor to work in it's range of storing electrons as a DC blocker or timing component. If the capacitor is allowed to discharge over time, this can change the capacitance of the capacitor or it's value. This in turn can make differences in other components such as timing or frequency accuracy.
Allowing the receiver to stay on for a time may restore the capacitors. In worse cases, the capacitor(s) may have to be changed out. Newer capacitors are built as cheap as possible sometimes with poor chemicals as the electrolyte. Money is saved by the manufacturer but leaves the consumer with a poor product.

SDR is the opposite of a physical radio. If you have a Degen, you don't need SDR. SDR makes sense on a computer. Besides shortwaves on SDR don't work really well.

I have an SDR dongle but I use it rarely because I can't get any signal, apart from commercial FM.

Is that possible that you mean digital signal, like rtty instead?

Hi Lino,
IMHO you can't 'convert' a radio into an SDR - you can connect the radio to an SDR to use the SDR as a detector but you still won't be able to control the tuning of the actual radio. I connected a "softrock" SDR to the IF of my Kenwood R2000 as an experiment and it worked - sort of! You could tune the SDR across the 45MHz of the IF plus or minus 2MHz or so but it took a lot of head scratching to work out what frequency I was actually listening to!

Better save up you hard-earned and buy a proper SDR - I have a couple of Winradio SDR's but they're a bit tough on the pocket to start off with! Brilliant receivers and great software, especially the G33DDC.

Actually shortwaves on SDR works very well IF you have a good SDR front-end; try something like a Perseus or ELAD FDM-S2 or similar (together with a good SDR software) and you will see what I mean.

Topic: 3657 Message: 3657

My 2004 DE1103 occasionally had a jog dial tuning problem but it now appears to be permanent and I need a replacement. I read some reviews about the DSP version, but the muting between frequencies is not compatible with my scanning style.

I have been using my radio on a daily basis and I would appreciate recommendations for available radios that more closely match the original de1103 without costing more than twice the DSP version.

I have the Kaito KA 1103 dual conversion PLL radio and wanted to state that the receive is as good as my other radios (Radio Shack DX 398 & DX 390). It is a joy to have this dependable radio!

3665. Fwd: I've just ordered the DEGEN DE31MS loop antenna

Yahoo group: de1103

From: Ottavio Caruso
Topic: 3665 Message: 3665

Hi all,

is anybody still there?

I hope this group has some subscribers left.

After more almost two years of not using the Degen DE 1103, due to AC interference, I decided to give the radio a go.

I really wanted to build my own loop, but as I'm renting my accommodation and have no tools to build a proper antenna, I decided to give the DEGEN DE31MS a go. Prices have fallen slightly, so I bought one at £15, including shipping from mainland China. Fingers crossed!

If/when I receive it, I'll post some feedback if anybody is interested.

In the meantime, if anybody has built their own loop, please share your experience.

I know I can find links on the Internet but I'd rather have feedback from personal experience.

In particular I'm interested in a small portable antenna for the lower bands (160 and 80m).

Digressing a bit, I'm also interested in building a regen receiver that covers from the 160m to the 20m. Any ideas will be appreciated.

Regards

Very interesting yes it will be interesting to see how this works.

Anon-Co http://www.anon-co.com/category/antennas have a few other variants which would also work. They're branded Tecsun but the only difference between that and Kaito will be the name.

The MW circular loops listed works very well I've been using mine for the past year and is good for picking up US, Mexico and Hawaiian MW stations. I'm in Christchurch, New Zealand.

Paul

Hi:
I am using the Degen DE31 MS with my DE 1103 and with my Grundig G5 (essentially the same radio). Works extremely well on both SW and MW, at least compared to the whip and to fairly short indoor wire antennas. Placement and orientation is very sensitive. I live in a wood frame house and find that the antenna works best hanging from the ceiling and not attached to window glass. I rotate the antenna for clearest signal and least noise on shortwave. (I do this once in setting the antenna up for listening, not for every station.)
Good luck--
Robert in California

Hi Octavia,
I have the antenna. It is a good little loop. However, the tuning is really sensitive. As you go to a frequency tune the knob very slowly.
There is a newer model out that Jay recently reviewed. It is also a bargain and according to Jay works a little better then the one you're considering. 73's and good DX'ing.
Thank you and best regards, Paul Juarez

at times we find people here.
I am an unfortunate buyer of 1103 that worked only for 2 hrs . I had returned back to seller at www.ebay.in and took refund.

however i suggest you may also try out pa0rdt active mini patch antenna, It won't need much space. you could google and even get the pxcb artwork and home brew even on a copper clad. For quite some time it worked for me and later i removed that.
all the best

3671. Degen de31ms loop antenna: first impressions

Yahoo group: de1103
Date: 2017-02-16 15:51:53 UTC
From: Ottavio Caruso
Topic: 3671 Message: 3671

In a nutshell: avoid!

Long story: I've just received my package from China (only 7 working days). The original package came without instructions, so I had to download a leaflet from eBay:

https://ae01.alicdn.com/img/pb/503/094/465/465094503_418.jpg

The ferrite for MW doesn't seem to do anything, but I don't really care.

Let's go to the loop.

I didn't expect miracles and in fact I didn't find them.

The whole idea is very crude and most likely would have come better, had I had the tools to build one from scratch.

The loop itself is a very thin and plain copper cable, kept stretched by a telescopic antenna (now, that's a way to recycle your unused FM portable radio).

Attached to it is a preselector SW/MW. I have no idea what the MW switch is supposed to do because the loop is not for the MW. Indeed all it does is to make the loop unusable, so just leave it to SW.

Then a 3m stereo mini jack to mini jack cable is connected to the loop. The other extremity to the mini tunable amplifier (2 x AAA batteries not included). Then from the amplifier a small cable connects to the antenna socket of the Degen receiver.

A small fragile clip is included, which is just enough to let the loop hang from my window curtain at the second floor.

I have tested the antenna on the 80, 40 and 20m bands because they are the only ones im interested in. Over the 20m band the loop doesn't seem to make any difference. The loop is not supposed to work at all on the 80m band, but it appears to do something and maybe someone can play on some modification.

Background: I tested it yesterday night at about 10pm. With the built in telescopic antenna I could only hear noise on the 40 and 20m bands and some fragments of QSO on the 80/75m.

Connecting the loop and tuning it on the 40 and 20m seems to reduce a lot of interference, as expected, but it didn't give me any QSO. I thought it had something to do with propagation, but I checked a local station on Websdr and there was plenty of QSO over there.

So out of desperation I tested the 80/75m band. Like I said it is supposed to work only on 3900 khz and higher, but I was able to tune some feeble QSO from a Spanish Ham (I'm in the UK) and that's it.

On the AM/broadcast bands it doesn't seem to do much. Maybe reducing a bit of noise but that's it.

All in all I can say that the antenna is not fit for purpose. If you can already tune some stations, it won't improve your reception by much. If your location is desperate, it won't do anything.

Maybe this antenna made sense 10/15 years ago, when signals were strong and interference was scarce, but as of today the short wave is pretty much a no go area if you live in the city and can't afford a proper antenna over your roof.

It's time sell my Degen on eBay. If anyone is interested in buying it, just email me off list.

3672. Re: Degen de31ms loop antenna: first impressions

Yahoo group: de1103
Date: 2017-02-21 04:43:02 UTC
From: robert gorsch
Topic: 3671 Message: 3672

Hi Ottavio:
The antenna definitely works in my location. I have found that I need to rotate it very carefully to find the most noise-free orientation. When I found the "clean" spot, the signal was definitely better than it was using the whip or the other short indoor wires I have. And you do have to tune for frequency very carefully; the tuning is super-sharp.
As for MW, it does quite well. With my Grundig G5 I just plug the loop antenna into the external antenna socket. With the DE-1103 you can't do that. That's what the ferrite coupler is for. You have to plug the loop, via the tuning unit, into the coupler and then place the coupler next to or on top of the radio so that the ferrite rod is next to and parallel to the radio's internal ferrite antenna. Then you switch the loop to MW and, voila, it does tune the medium wave band.
Setting it up for MW might be a good test for you. See if you can minimize local noise by rotating the antenna, then tuning a weak station that you know is there and can receive on the radio without the antenna or on another radio. With the loop you should be able to get a much better, stronger signal. If not, perhaps your local RFI is so great that it is desensitizing the radio. This happened to me when I had a computer in the room that emitted such terrible EMI that I could hardly hear local MW stations.
Best,
Robert

Hi Octavio,
Same here. Mine works wonderful. However, when using the tuning control you must move it very slowly, otherwise you will miss the sweet spot. Also, make sure your battery is freash. I live in a condo and the RF noise level is very high. Proper location is paramount to good reception. I happen to be lucky in that my room window is perfect location for the antenna.
Good luck and 73's!☐
Thank You,
Paul Juarez

Yes, a bit. I just tried it on a local AM station, carefully setting zero-beat and I estimate the drop is about 10dB. It was necessary to increase volume setting from 11 to 14 to get the same loudness. A noticeable drop but still quite audible

@Peter - Do I have to? I mean nothing is wrong with the radio aside that I could hardly hear some Hams.

@Paul - I have a string wire I hang to a pole outside. It does improve reception but it also brings up more noise. I am not an expert in building antennas so I'm thinking of buying one but I really don't know which one.
